# Motivation

- The central enrollment mechanism described in RELOAD requires to manage a CA certificate for the purpose of signing the user's certificates.
- There may be other functions, like OAM access that could use the same CA, if there is a way to be sure that a certificate issued for the overlay cannot be used for these other functions.

# Proposal

- Define a new EKU.
- Because it is probably too late to add it in the base spec, enforcement is optional (mandatory-extension).
- Already deployed with experimental values.
- Support on the mailing-list.
