RTP Handling for SIPREC
(draft-ietf-siprec-protocol-08)

Charles Eckel (eckelcu@cisco.com)

IETF 85 SIPREC WG Meeting
November 8, 2012
SRC Using Multiple m-lines

- CS CNAMEs => RS CNAMEs
- CS SSRCs => RS SSRCs

- If SRS does not support, it rejects one or more m-lines, and SRC might choose another option.
If SRS does not support CSRC, it relies on metadata.
If SRS does not support, SRC finds out through RTCP receiver reports and might choose another option.
If SRS does not support, SRC finds out through RTCP receiver reports and might choose another option

SRC may need to rewrite SSRCs to avoid collisions

SRS relies on metadata as CNAME is not preserved
**TODO**

- **RTP Session Usage**
  - Should any specific RTP session usage be recommended or prohibited?
  - What happens if UA is sending mixed stream already to SRC?

- **Correlation between metadata and RTP?**
  - CNAME/SDES/SSRC/CSRC may/may not be used by UAs

- **SRTP/Keying Mechanism**
  - Mention in security section that EKT may be used to interwork with SDES without requiring media decrypt/encrypt by SRC
