

RSVP-TE Signaling Extension for Bandwidth Availability

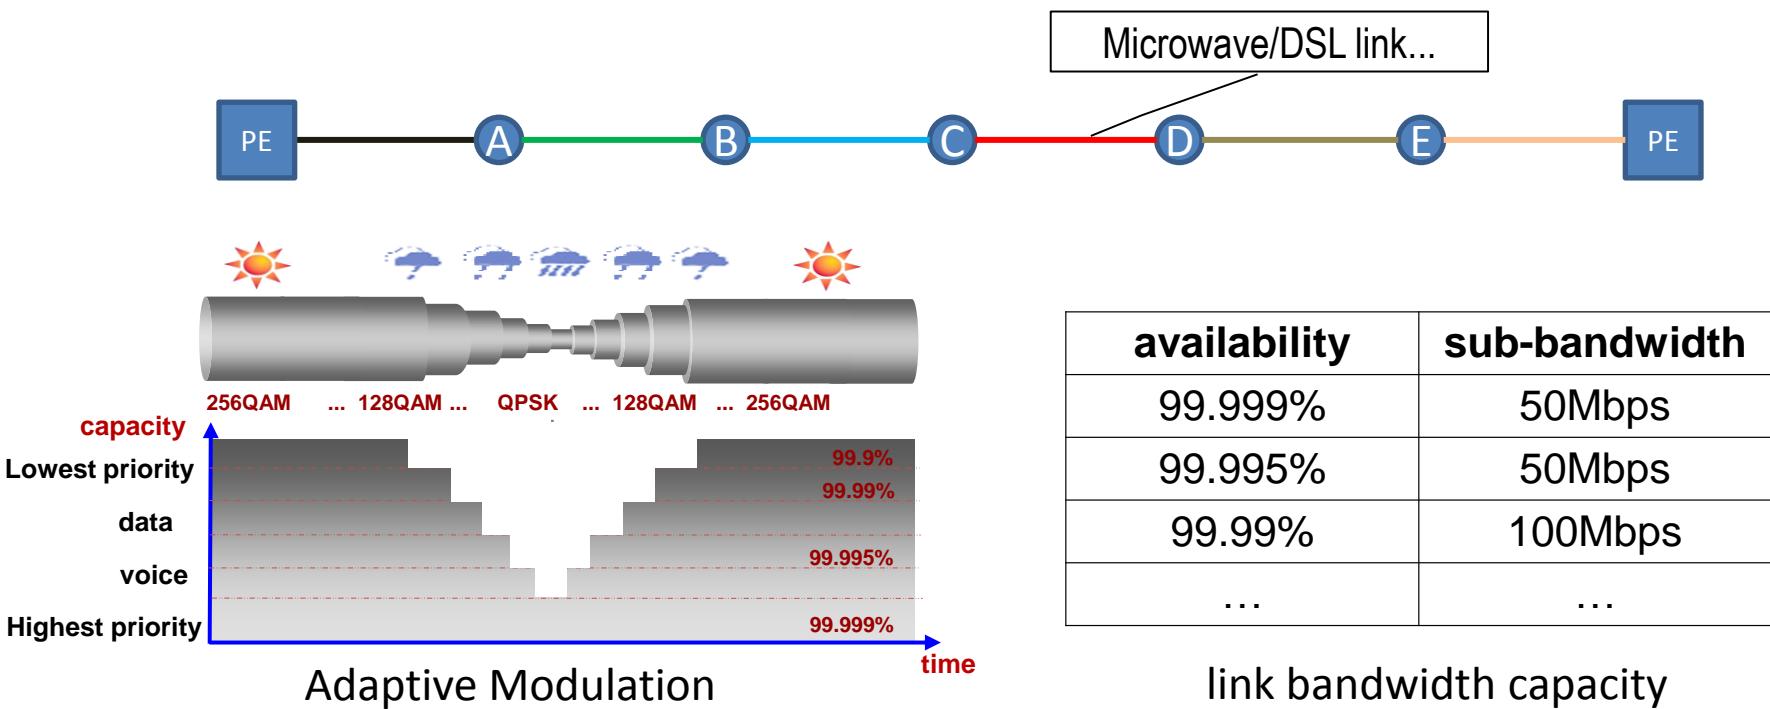

draft-long-ccamp-rsvp-te-availability-00

HAO LONG (longhao@huawei.com)

MIN YE (amy.yemin@huawei.com)

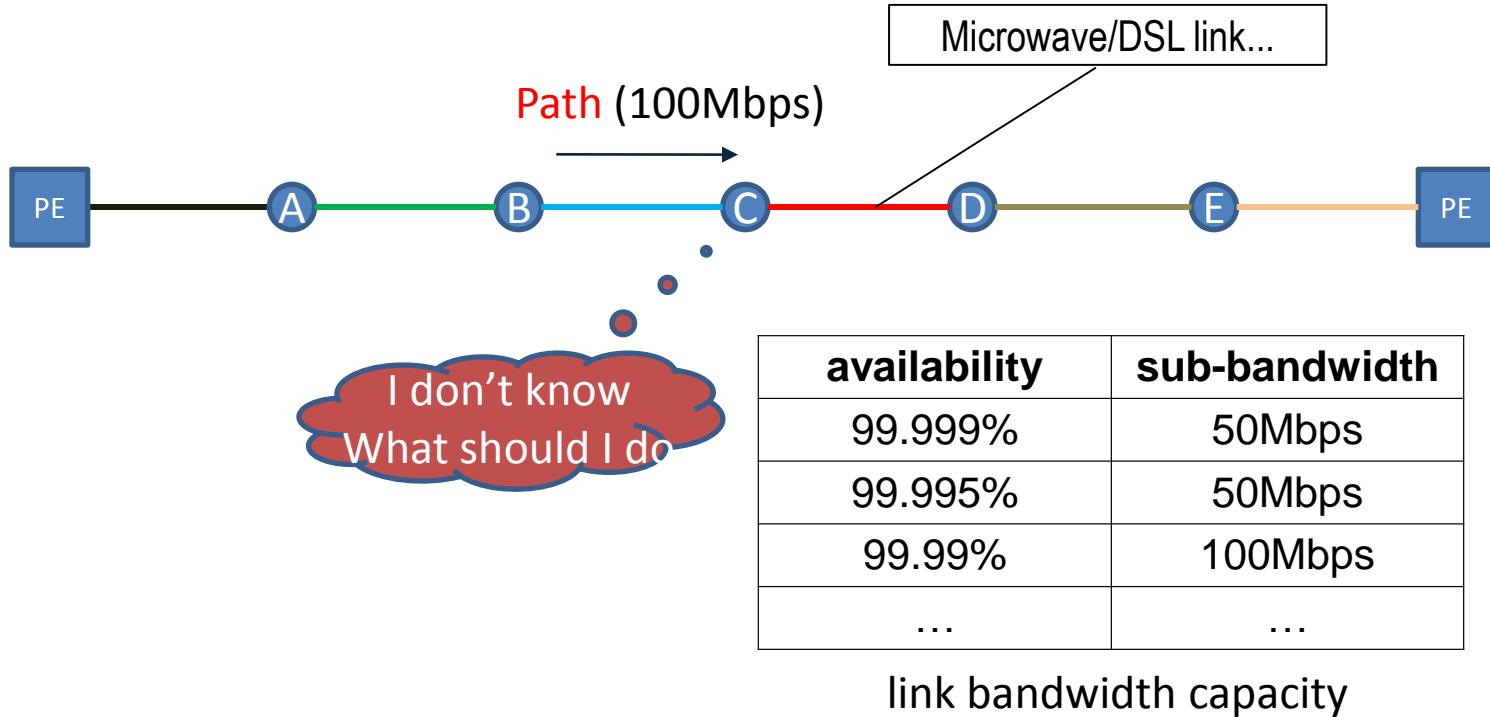

IETF 86 CCAMP March 2013 Orlando

Problem Statement

- Packet switching network may pass through the links with variable bandwidth
 - Microwave: affected by environment, e.g., rain, fog, dust, snow,...
 - DSL: affected by environment, e.g., noise interference,....

Problem Statement

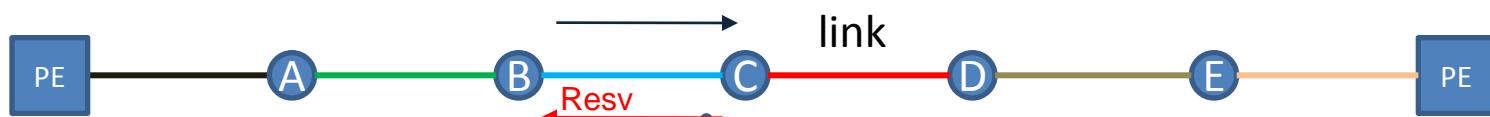

- Node C don't know whether the link can satisfy the bandwidth requirement
 - Have no idea which bandwidth capacity should be used ;

Proposed Solution

Example 1

Path ($<30\text{Mbps}, 99.999\%>$,
 $<30\text{Mbps}, 99.995\%>$,
 $<40\text{Mbps}, 99.99\%>$)

e.g., for voice
e.g., for video
e.g., for VPN

availability	sub-bandwidth
99.999%	50Mbps
99.995%	50Mbps
99.99%	100Mbps
...	...

link bandwidth capacity

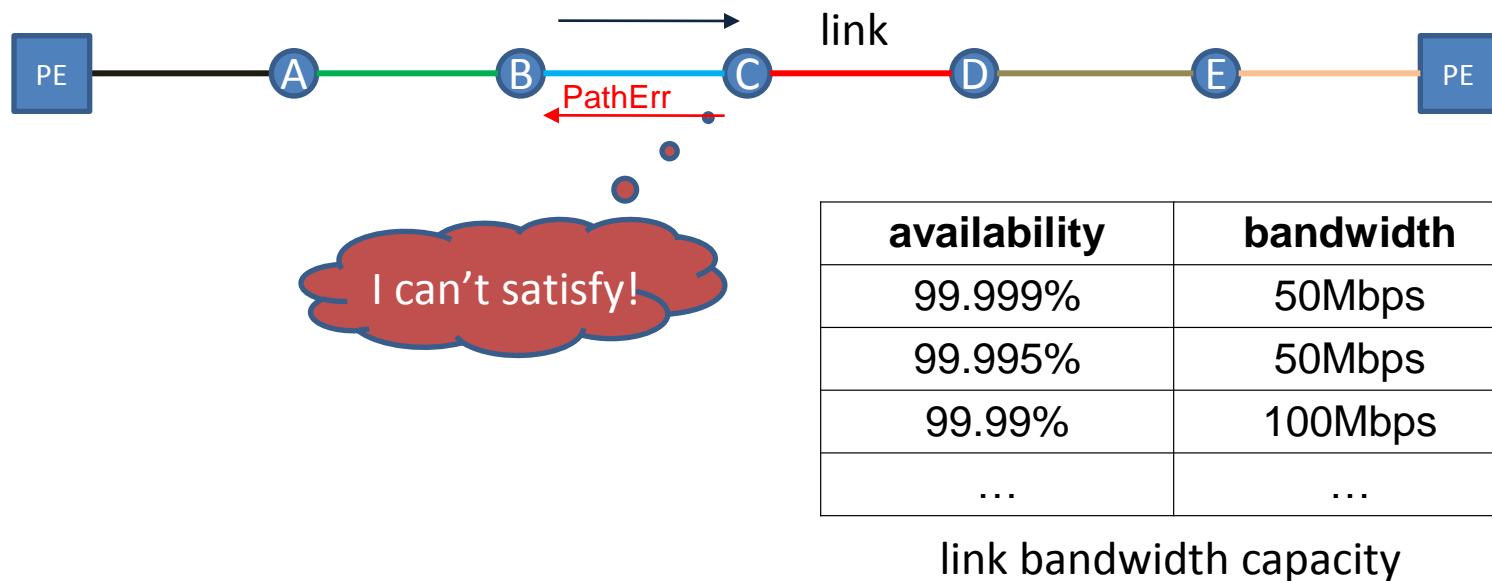

- If specify sub-bandwidth-requirement with availability requirement
- If all bandwidth requirements can be satisfied , Node C should allocate the bandwidth resource from each unallocated bandwidth portion

Proposed Solution

Example 2

Path ($<70\text{Mbps}, 99.999\%>$,
 $<20\text{Mbps}, 99.995\%>$,
 $<10\text{Mbps}, 99.99\%>$)

e.g., for voice
e.g., for video
e.g., for VPN

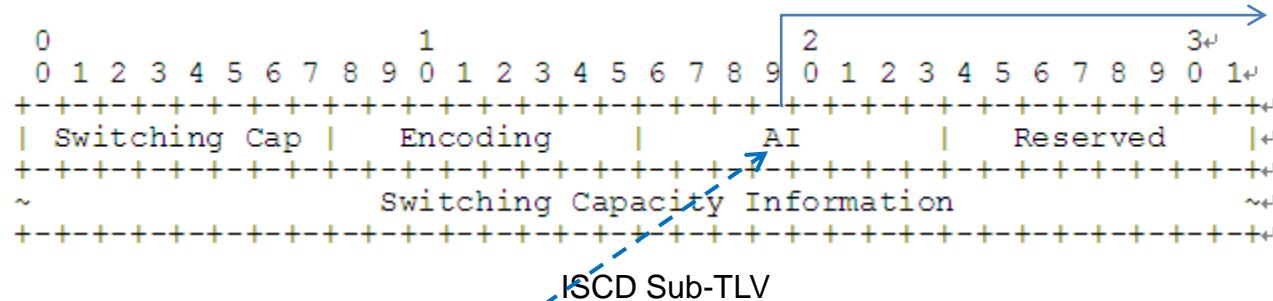

- If at least one bandwidth requirement cannot be satisfied, Node C should generate PathErr message with the error code "Traffic Control Error" and the error value "Bad Tspec value".

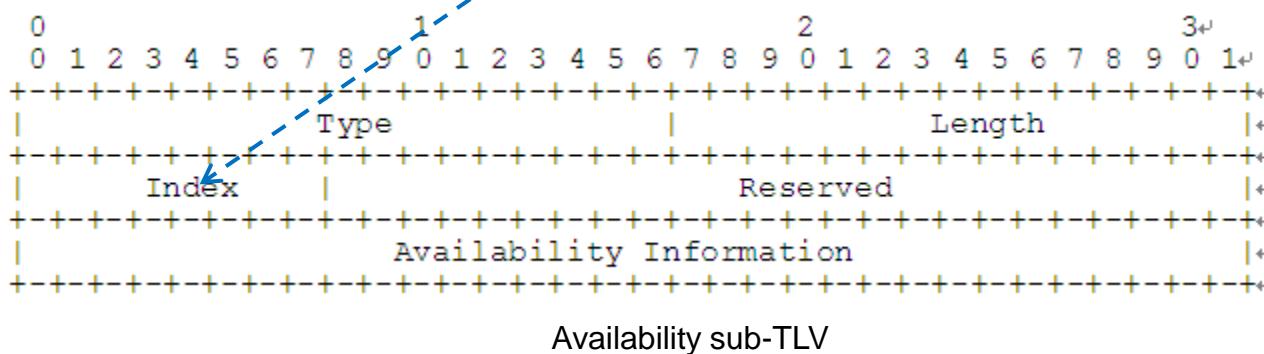

Technical Requirements

- R1: The routing message should carry availability information during the interface switching capacity propagation for routing computation.
- R2: The path message should carry multiple bandwidth requirements for different availability;

Proposed Extension to Routing

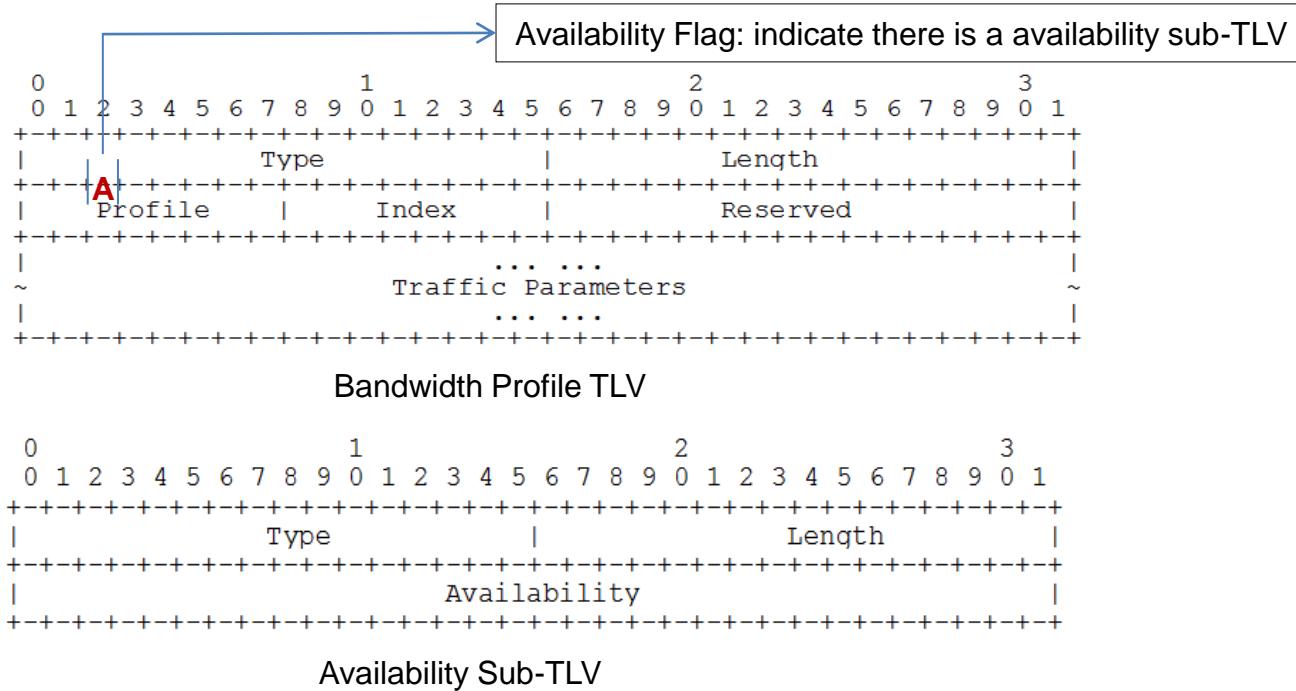

Availability sub-TLV index : to indicate the index of availability sub-TLV

- Define an availability index field in the ISCD sub-TLV
- Define an availability sub-TLV to notify the availability information
 - RFC 4203 supports one link state advertisement message carries multiple ISCDs (interface switching capacity descriptor) for one interface. Extension is required for associating each ISCD sub-TLV with an availability sub-TLV by an index value

Proposed Extension to RSVP-TE

- Define an Availability flag in the “Profile” field in bandwidth Profile TLV
- Define an availability sub-TLV to specify the availability requirement
 - RFC6003 has specified one Sender_TSpec can carry multiple bandwidth Profile TLVs. Extension is required to include availability sub-TLV

Next step

Comments are welcome.

Thanks
