

Advertising MPLS labels in IGP

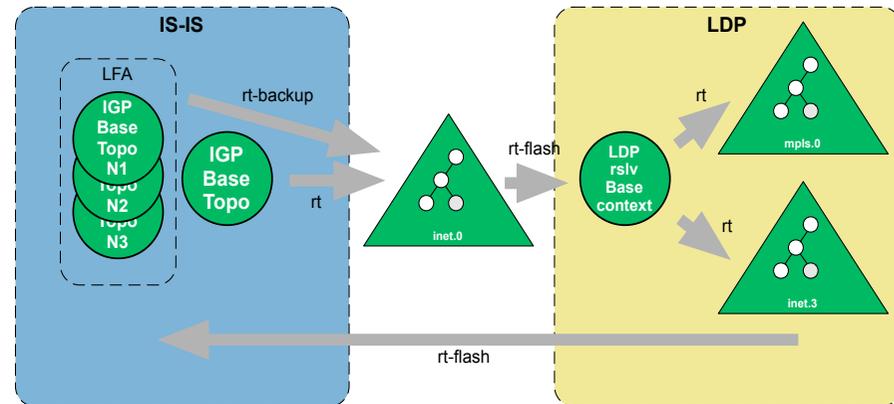

draft-gredler-rtgwg-igp-label-advertisement

Hannes Gredler
<hannes@juniper.net>

IETF86
March 2013

Motivation and Rationale

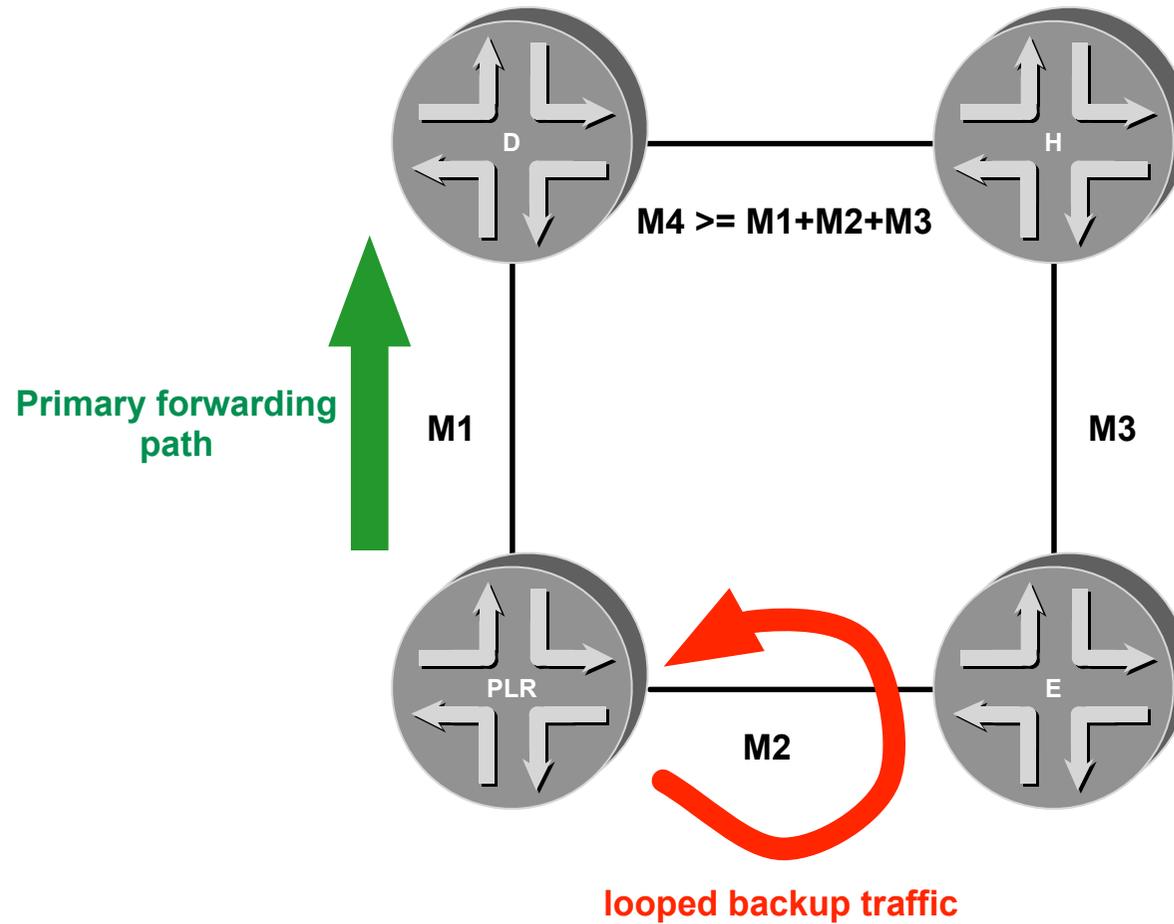

- R-LFA implementation requires more tight integration of LDP and IGP
 - **Bi-directional** notification path between protocols
- MPLS transport label distribution are Session oriented protocols
 - You need to have a **session** with a neighbor in order to receive/distribute bindings
- Interesting use cases for >1 hop distribution of transport labels

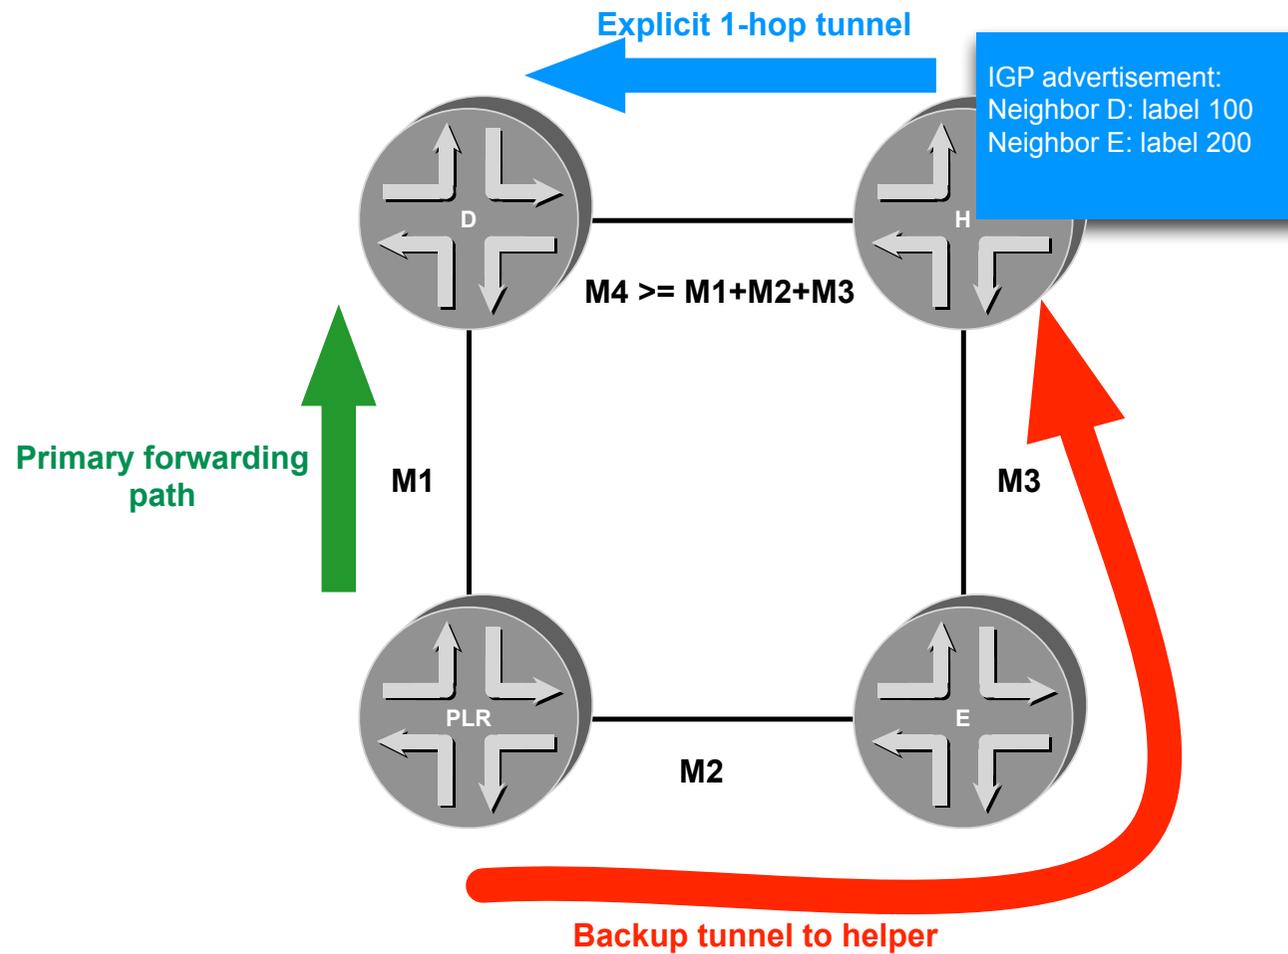

USE CASE #1

INCREASE (R-)LFA COVERAGE

Pathologic Topologies

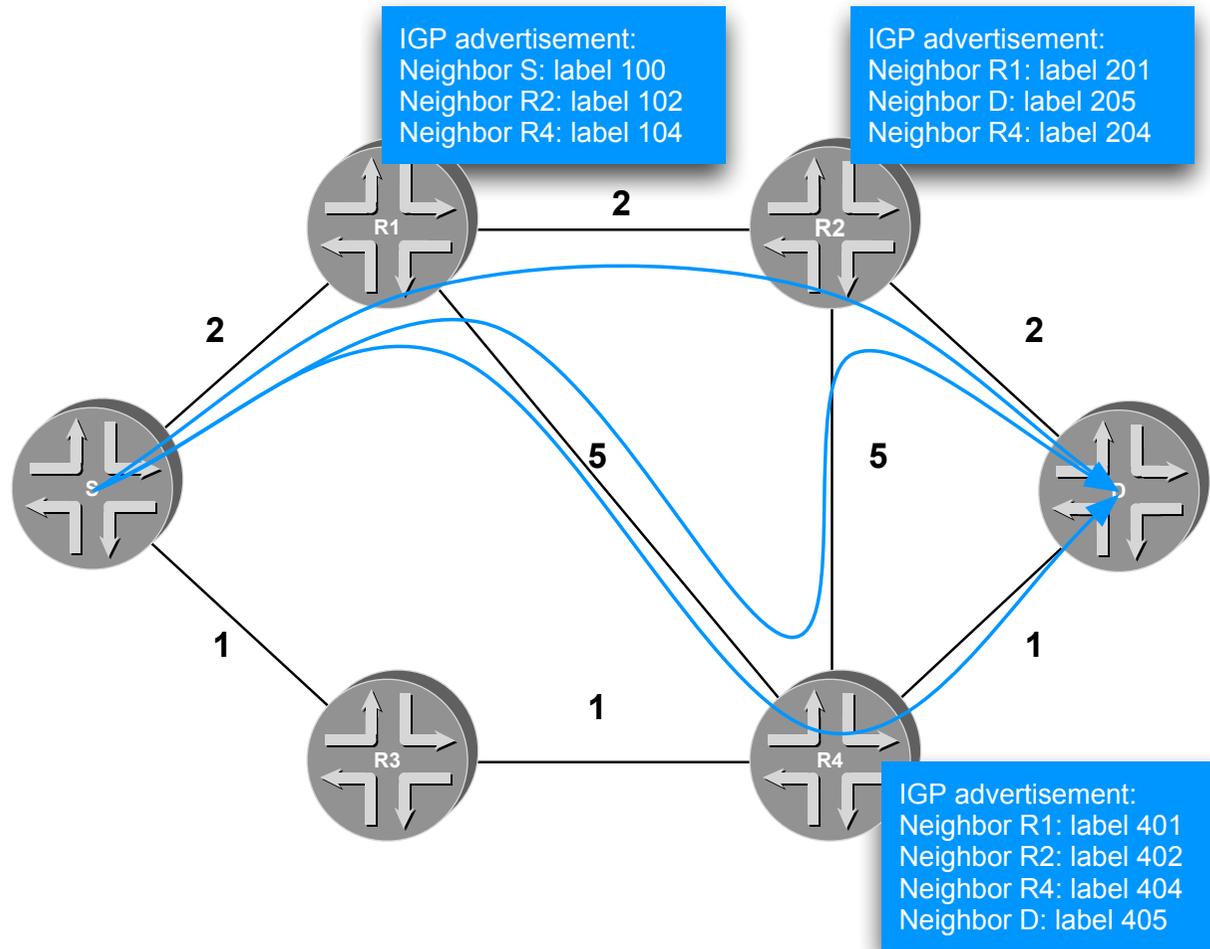

Add one-hop strict forwarding labels (stack 'em)

USE CASE #2
TE BY LABEL-STACKING

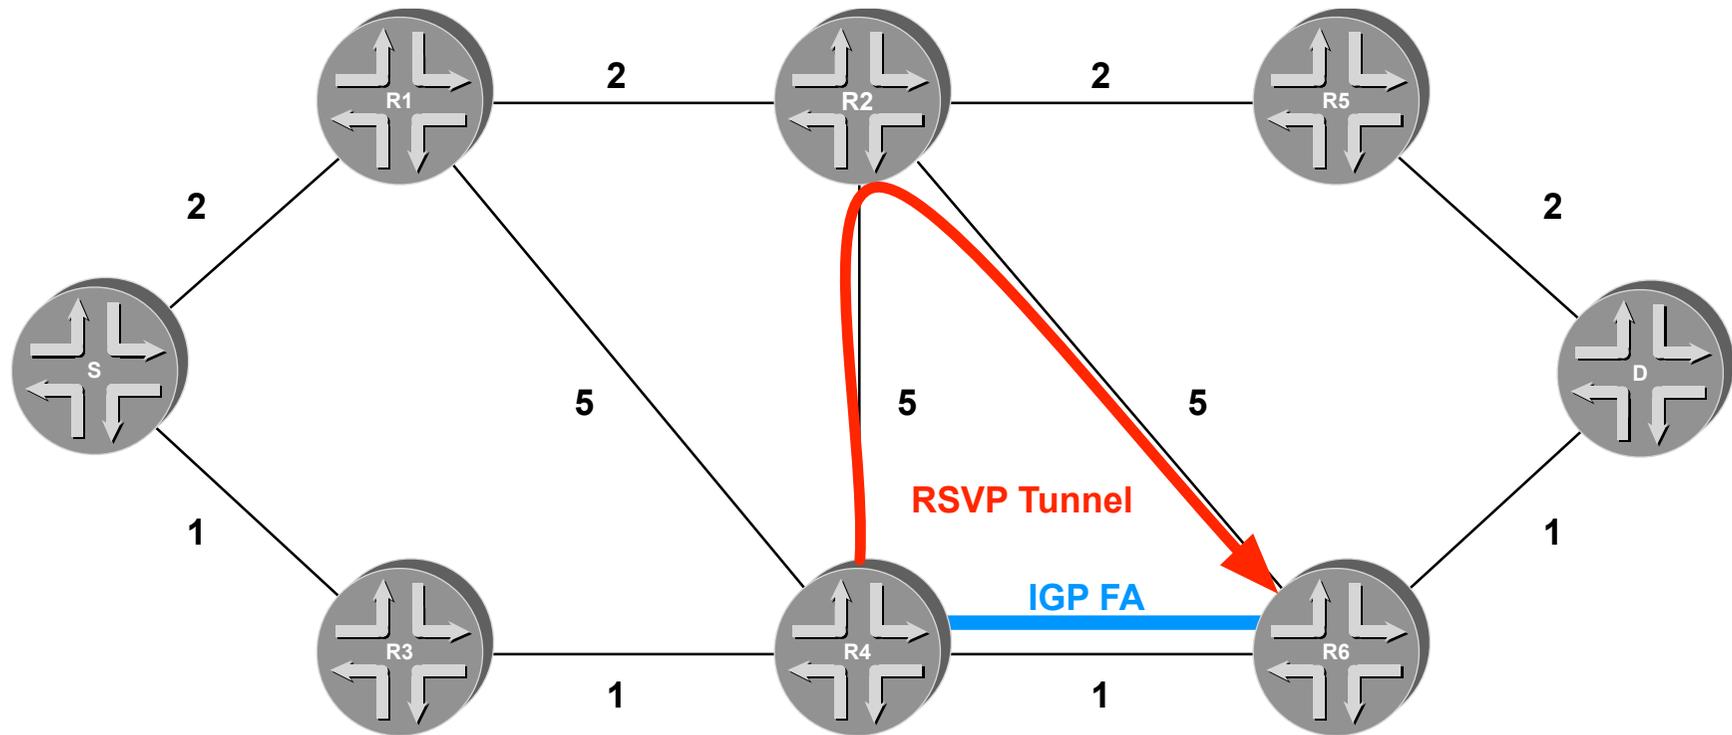

TE by label stacking per-neighbor labels

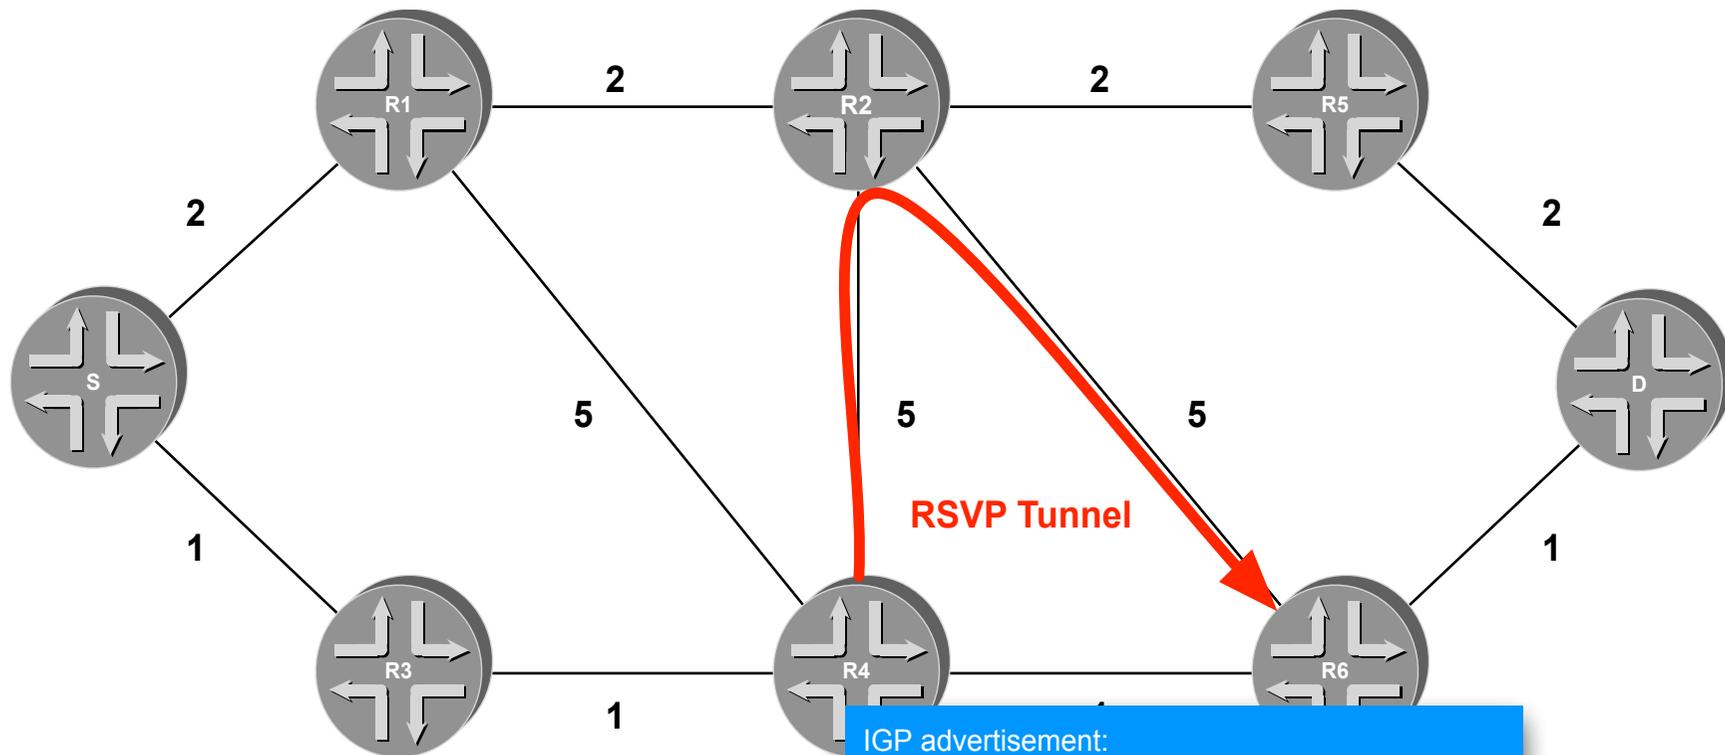

USE CASE #3
ADVERTISING TELESP

Advertise RSVP LSPs as Forwarding Adjacency

Issue: LSP path properties lost

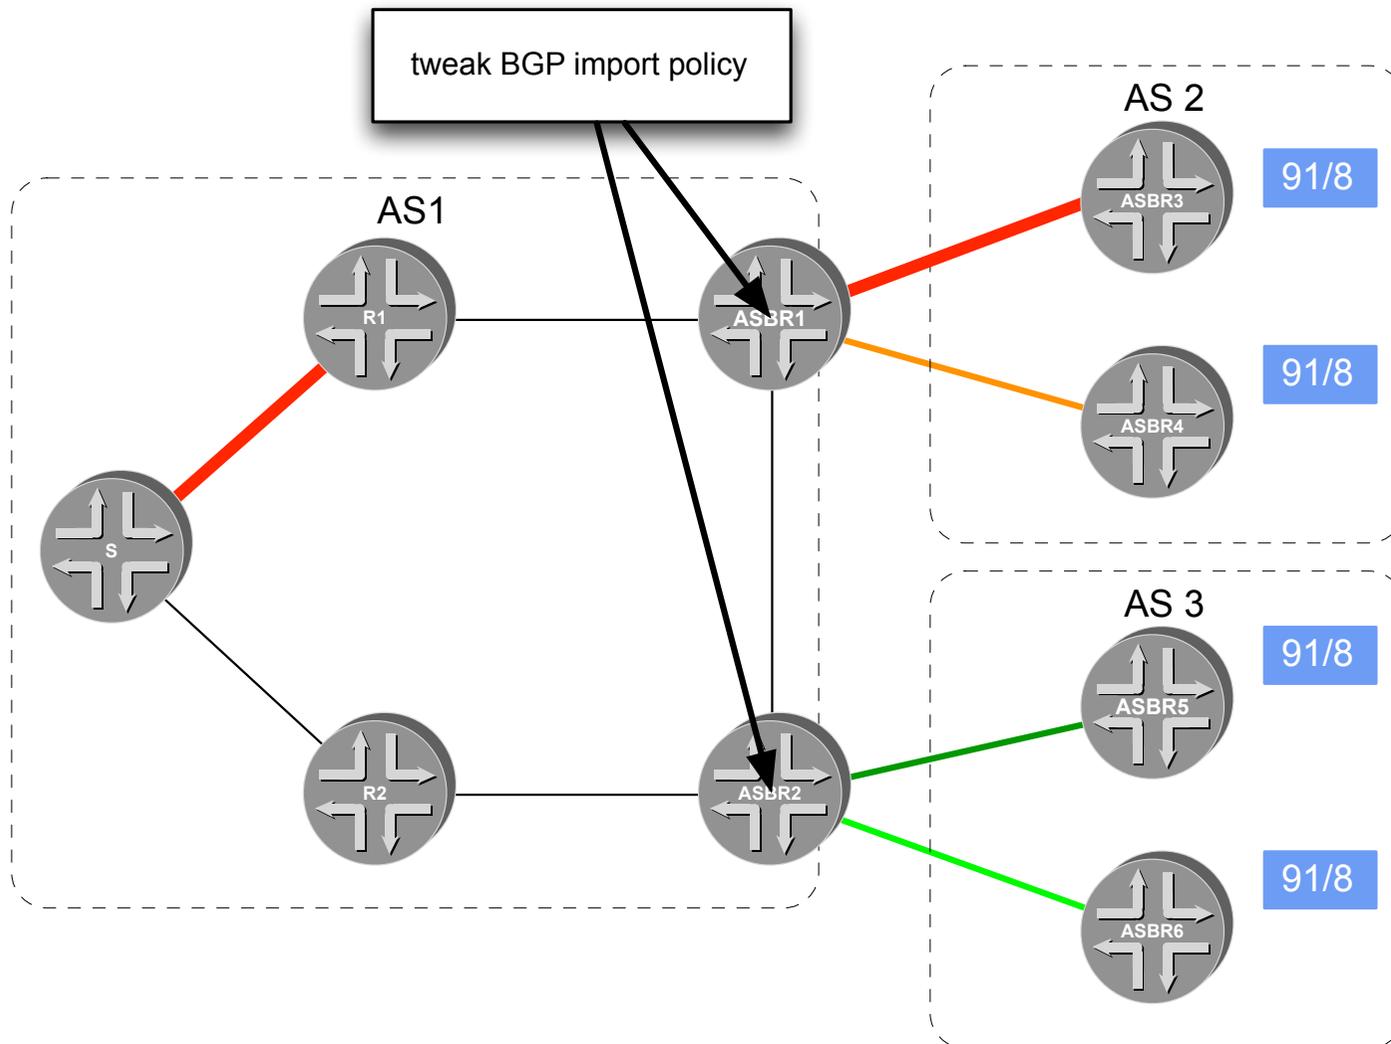

Advertise existing LSPs & EROs
-> Allows path property correlation

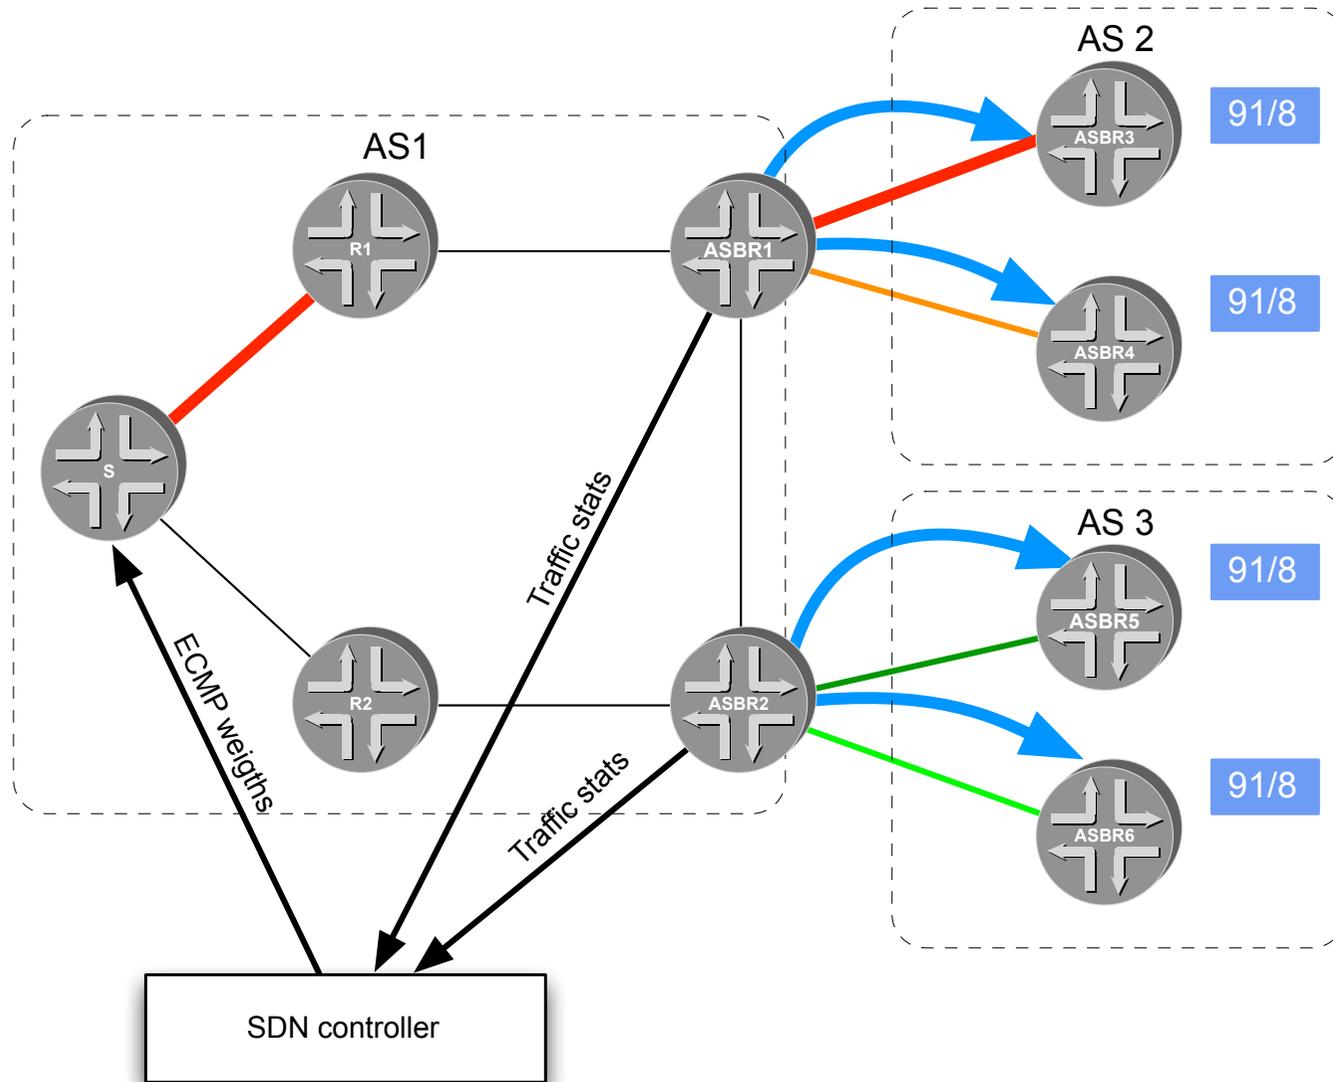

IGP advertisement:
Neighbor R1: label 401, ERO (R1)
Neighbor R2: label 402, ERO (R2)
Neighbor R3: label 403, ERO (R3)
Neighbor R6: label 406, ERO (R6)
Neighbor R6: label 407, ERO (R2, R6)

USE CASE #4
EGRESS WAN SDN CONTROL(ER)

Current TE framework only offers egress Node control.
-> No good Egress **Link** control

SDN ECMP weight controller and per-neighbor label

Next Steps

- Yesterday (20130313) submission isis-wg
 - draft-previdi-filsfils-isis-segment-routing-00
 - Core is advertising “segments” for source routing
 - IGP disseminates “segment”
 - Some similarities (IGP label)
 - Some discrepancies (Advertising existing labels, Global labels)
 - Working with authors to assess draft merge
