# **DMARC BoF**

## **Domain-based Message Authentication, Reporting and Conformance**

**Time:** Tuesday, July 30th at 1520

**Room:** Potsdam 1

**Chair:** Russ Housley

### **Description:**

SPF (RFC 4408) and DKIM (RFC 6376) provide domain name authentication for email. DMARC lets a sender indicate that they employ SPF or DKIM, tells what to do if authentication fails, and provides a reporting to domain owners.

Should a working group be formed to specify DMARC enhancements and produce DMARC usage guidance?
