

SNMP configuration data model

Jürgen Schönwälder

draft-ietf-netmod-snmp-cfg-02

Current Status

- Published draft-ietf-netmod-snmp-cfg-02 in April which provides a reusable grouping for the TLS certificate to name mapping (used by the NETCONF over TLS I-D in the NETCONF WG)
- Add some discussion concerning running config and StorageType to the document (based on dbh's comment to the interfaces document). It is not yet clear how to resolve this. Juergen and Martin will discuss and try to propose something
- Some editorial clarifications will be forthcoming in -03.
