

NAI (4282bis)

RADEXT - IETF 87

What's new

- -04 issued with review from Bernard, etc.

Main sticking point

- Normalization done at the edge or the core?
- We know we can do it at the edge.
 - But no one does it: upgrade 1B devices
- It's easier at the core (1000s of proxies)
 - But we don't know if it's possible

Feedback from i18n

- Very little feedback from i18n people
- It may be possible, may not
- Publish, or ... ?

Discussion?
