

-addldata-subnot

BRIAN ROSEN, NEUSTAR

Summary

- Defines a way to update Additional Call Data that is PSAP controlled
- Use case is sensor data, such as building alarm status, which can change during a call
- PSAP control of rate of update (if they want any updates) is essential
- Defines a new block of additional data that sends a SUBSCRIBE URI, to which a filter spec can be added
- NOTIFY is a set of additional data blocks as mime/multipart

Status

- Updated (late) to add text on how a device uses an external server
 - Added a PUBLISH object for device to update server
- Chairs were to figure out if a more general solution was warranted. Did not happen AFAICT.
- Some folks want an INFO package
 - Great, write a draft. I think Sub/Not is better b/c it gives PSAPs control.
