# Overview

- Two drafts
  - Different origins
  - Separate the different issues
- Define the format of a flexi-grid label in the context of RFC 6205 LSC labels
  - What quantity is switched (Slot Width (GHz) = 12.5 GHz \* m)
  - What resource is reserved (Grid= ITU-T Flex)
- Update to traffic parameters (TSpec and FlowSpec) to specify the flexi-grid bandwidth information
- Signaling procedure
  - Basic signaling procedure followed
  - New Objects/parameters need to be used

# Changes from Previous Versions

- Ensured consistency between the two drafts
- Updated label and traffic parameter format
  - Changed length of **m** field to 16 bits for future-proofing
- Added sections on “Implementation Status” (RFC 6982)
  - CTTC
  - More additions planned
- Editorial updates through the draft, including Contributor and Acknowledgment sections

# Open Issues and Next Steps

- Should we make the channel spacing more flexible?
  - Currently CS value 5 means channel spacing is 6.25 GHz
  - We could make this a variable parameter
    - Prefer to revisit this using CS value 6 in the future if it becomes an issue
- How do we handle concatenation and virtual concatenation?
  - It seems we already have mechanism in GMPLS (e.g., RFC6344, etc.)
- These should all be questions for the working group (not just the authors)
  - Framework is already a WG draft
  - Time to adopt these two drafts into the WG
