

# draft-rosen-ecrit-lost-planned-changes

- Changes in data within a LoST server happens, usually planned events (like annexation)
- This means records in a LIS that were valid become invalid
- No way to push invalidation out to LIS, have to depend on periodic revalidation
- Draft proposes a new element to <findService> request:
  - URI to be saved with location
  - AsOf date to perform validation against
  - Also includes object pushed to LIS @ URI that contains AsOf invalidation date

v2

- Added TTL
- Provided some guidance on periodic revalidation
- Adopt?
