IETF 90

Toronto, ON, Canada

Draft Goals

- Establish a common understanding about a set of scenarios that can be used as a base for ICN evaluation
- Provide equal ground for comparison, an agreed framework
- Scenarios should be general enough and “technology agnostic”, although scenario detail may vary
- Aim to get feedback from implementers, both on the scenario definition and level of detail
- All approaches need not implement all scenarios
 - but all scenarios should end up illustrated in a real demo

Current Status

- Draft ready for publication
 - In general agreement it's time to move on
 - No non-supportive emails, we believe the draft has the support of ICNRG
 - No further contributions or discussion on the mailing list since London
 - Review in IRTF still pending
