

draft-thubert-6lo-rpl-nhc

Problem with RPL option [[RFC6553](#)]

8-octets overhead for HbH header in data pkt

Almost innocuous with G-PHY (ZigbeeIP, CG-Mesh)

May cause fragmentation with classical PHY (127 octets/Frame in 2.4 GHz band)

Not compressed by 6LoWPAN HC

Wasted Energy in constrained devices

Additional IP-in-IP encapsulation

Deeply aggravating factor for energy consumption and fragmentation

6TiSCH supports classical PHY

Overheads above are show stoppers for adoption

6lo solution vs. Flow Label

- Flow Label compresses RPI down to 20 bits
- Flow label avoids IP-in-IP encapsulation
- Flow Label needs 6MAN approval
- 6lo/NHC is unambiguous about RPI
- 6lo/NHC allows to compress 2-byte rank
- 6lo/NHC is a compressed form of RFC 6553 as opposed to a new format

draft-thubert-6lo-rpl-nhc

Status

- 02 published
- Priority work due to 6TiSCH dependency

Includes

- 6lo next header compression (NHC) for the RPI*
- 3 proposals for the exact format to debate

What's new?

- Converged existing drafts ([I-D.bormann-6lo-rpl-mesh](#))

* Really: a compressed form for an IPV6 HbH header with a RPL Option that transports the RPL Packet Information (RPI)

Compressing the RPLInstanceID

For the global Instance 0, the RPLInstanceID field is all zeroes
Define 'I' flag that, when set, signals a global Instance 0, elided.

Compressing the SenderRank

`DAGRank(rank) = floor(rank/MinHopRankIncrease)`

If `MinHopRankIncrease` is set to a multiple of 256, the least significant 8 bits of the `SenderRank` will be all zeroes; by eliding those, the `SenderRank` can be compressed into a single byte.

Define a 'K' flag that, when set, signals that a single byte is used.

Compressing the RPLInstanceID

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
| NHC: I=1, K=1 |   SenderRank   |
```

The most compressed RPI_NHC

```
0                               1                               2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
| NHC: I=1, K=0 |           SenderRank           |
```

Eliding the RPLInstanceID

Possible NHC encodings

“Greedy” encoding option

Uses NHC 1:0:x:x:x:x:x for RPL opt. flags + NH flag

“Conservative” encoding option

Adds to Ext. ID enum. of RFC 6282 LOWPAN_NHC

An additional byte for RPI flags (vs. Greedy)

“Efficient” encoding option

Trades Complexity for NHC footprint

Compression as good as “Greedy” in normal case

Breaks from simple RFC 6282 encoding model

Defines new escape mechanism

Inserts byte upon forwarding exception

draft-thubert-6lo-rfc6775- update-reqs

Goals

- 6LoWPAN host attachment to L3 (RPL) mesh
- Host mobility within the L3 mesh
- Registration for Proxy ND operations
- Separation of roles 6LBR vs. 6BBR
- Secure registration and address protection

draft-thubert-6lo-rfc6775-update-reqs

Draft Status

- 05 published (time to pass ownership to WG)

Draft Includes

- Requirements from Industrial networks (6TiSCH)
- Requirements from AMI/AMR networks
- 23 requirements total

What's new?

- Simplified content down to 5 pages of pure reqs
- Overview referencing 6TiSCH architecture
- Moved proposed changes to appendix

Requirements Related to Mobility

Req1.1: Upon a change of point of attachment, connectivity via a new 6LR **MUST** be restored timely without the need to de-register from the previous 6LR.

Req1.2: For that purpose, the protocol **MUST** enable to differentiate multiple registrations from a same 6LoWPAN Node from two different 6LoWPAN Nodes claiming a same address.

Requirements Related to Mobility

Req1.3: This information **MUST** be passed from the 6LR to the 6LBR, and the 6LBR **SHOULD** be able to clean up the stale state asynchronously in the previous 6LR.

Req1.4: A 6LoWPAN Node **SHOULD** also be capable to register a same Address to multiple 6LRs, and this, concurrently.

Requirements Related to Routing Protocols

Req2.1: The ND registration method SHOULD be extended in such a fashion that the 6LR MAY advertise the Address of a 6LoWPAN Node over RPL and obtain reachability to that Address over the RPL domain.

Req2.3: Depending on their applicability to LLNs, other standard mesh /MANET protocols MAY be considered as well.

Requirements Related to Routing Protocols

- Req2.2: The Address Registration Option that is used in the ND registration SHOULD be extended to carry enough information to generate a DAO message as specified in [\[RFC6550\] section 6.4](#), in particular the capability to compute a DAOSequence and, as an option, a RPLInstanceID.

Requirements Related to Routing Protocols

- Req2.4: Multicast operations SHOULD be supported and optimized. Groups MAY be formed by device type (e.g. routers, street lamps), location (Geography, RPL sub-tree), or both. RPL already has the capability to advertise multicast groups; whether ND is appropriate for the registration to the 6BBR is to be defined, considering the additional burden of supporting the Multicast Listener Discovery Version 2 [[RFC3810](#)] (MLDv2) for IPv6.

Requirements Related to the Variety of Low-Power Link types

Req3.1: The support of the registration mechanism SHOULD be extended to more LLN links, matching at least the links that are considered by 6lo as well as other popular Low-Power links such as Low-Power Wi-Fi.

.

Requirements Related to the Variety of Low-Power Link types

Req3.2: As part of this extension, a mechanism to compute a unique Identifier should be provided, with the capability to form a Link- Local Address that can not be a duplicate. The Identifier SHOULD be unique at least to the domain where an Address formed by this device may be advertised through ND mechanisms.

Requirements Related to the Variety of Low-Power Link types

Req3.3: The Address Registration Option used in the ND registration SHOULD be extended to carry the relevant forms of unique Identifier.

Requirements Related to Proxy Operations

Req4.1: The registration mechanism SHOULD enable a third party to proxy register an Address on behalf of a 6LoWPAN node that may be sleeping or located deeper in an LLN mesh.

Requirements Related to Security

Req5.1: 6LoWPAN ND security mechanisms SHOULD provide a mechanism for the 6LR, 6LBR and 6BBR to authenticate and authorize one another for their respective roles, as well as with the 6LoWPAN Node for the role of 6LR.

Requirements Related to Security

Req5.2: 6LoWPAN ND security mechanisms SHOULD provide a mechanism for the 6LR and the 6LBR to validate whether a new registration corresponds to a same 6LoWPAN Node, and, if not, determine the rightful owner, and deny or clean-up the registration that is deemed in excess.

Requirements Related to Security

Req5.3: 6LoWPAN ND security mechanisms SHOULD lead to small packet sizes. In particular, the NS, NA, DAR and DAC messages for a re-registration flow SHOULD NOT exceed 80 octets so as to fit in a secured IEEE802.15.4 frame.

Requirements Related to Security

Req5.4: Recurrent 6LoWPAN ND security operations **MUST NOT** be computationally intensive on the LoWPAN Node CPU. When a Key hash calculation is employed, a mechanism lighter than SHA-1 **SHOULD** be preferred.

Requirements Related to Security

Req5.5: The number of Keys that the 6LoWPAN Node needs to manipulate SHOULD be minimized.

Req5.6: The 6LoWPAN ND security mechanisms SHOULD enable CCM* for use at both Layer 2 and Layer 3, and SHOULD enable the reuse of security code that has to be present on the device for upper layer security such as TLS.

Requirements Related to Security

Req5.7: Public key and signature sizes **SHOULD** be minimized while maintaining adequate confidentiality and data origin authentication for multiple types of applications with various degrees of criticality.

Requirements Related to Low-Power devices

Req6.1: The registration mechanism SHOULD be applicable to a Low- Power device regardless of the link type, and enable a 6BBR to operate as a proxy to defend the registered Addresses on its behalf.

Requirements Related to Low-Power devices

Req6.2: The registration mechanism SHOULD enable long sleep durations, in the order of multiple days to a month, for devices capable of operating over the course of ten or more years without the need to recharge or replace the batteries.

Requirements Related to Low-Power devices

Req6.2: The registration mechanism SHOULD enable long sleep durations, in the order of multiple days to a month, for devices capable of operating over the course of ten or more years without the need to recharge or replace the batteries.

Requirements Related to Scalability

Req7.1: The registration mechanism SHOULD enable a single 6LBR to register multiple thousands of devices.

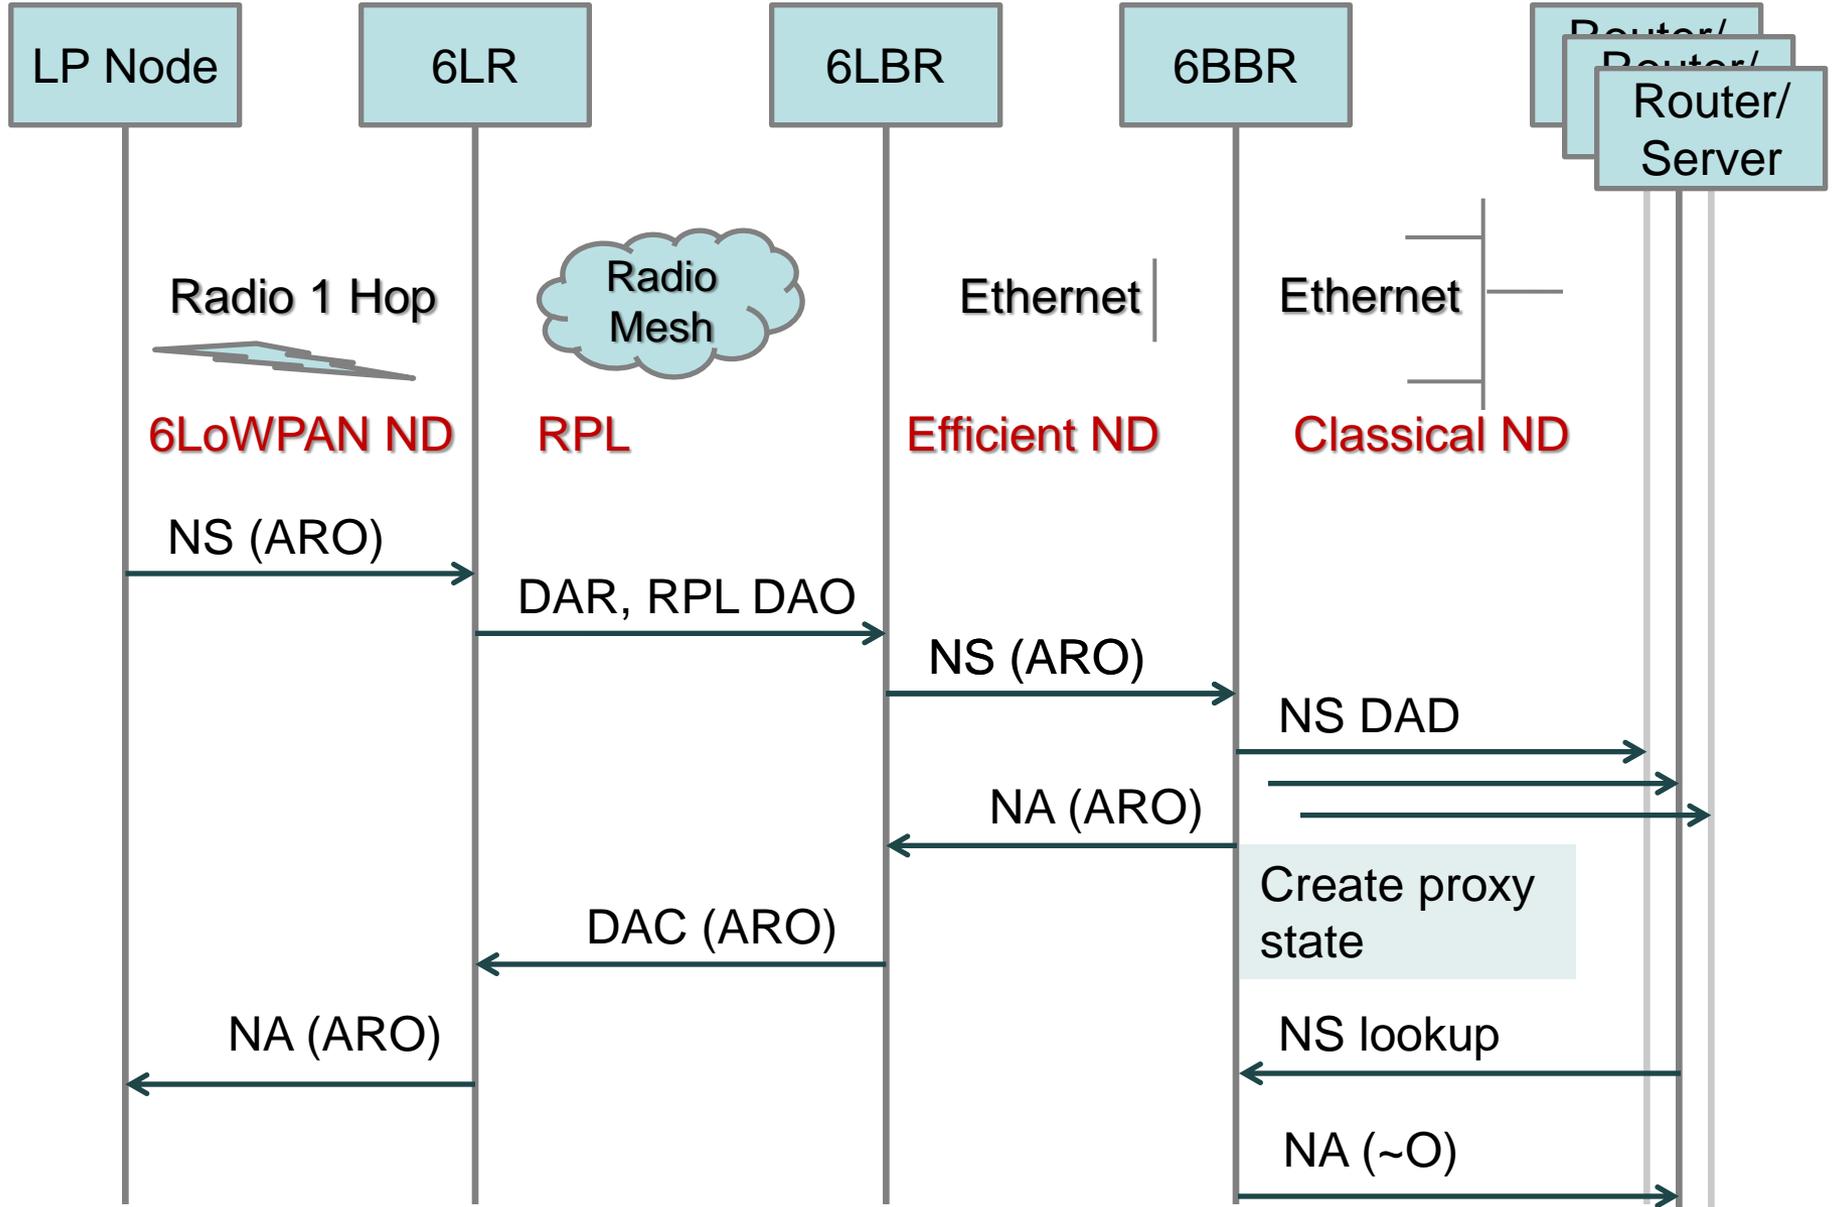

Req7.2: The timing of the registration operation should allow for a large latency such as found in LLNs with ten and more hops.

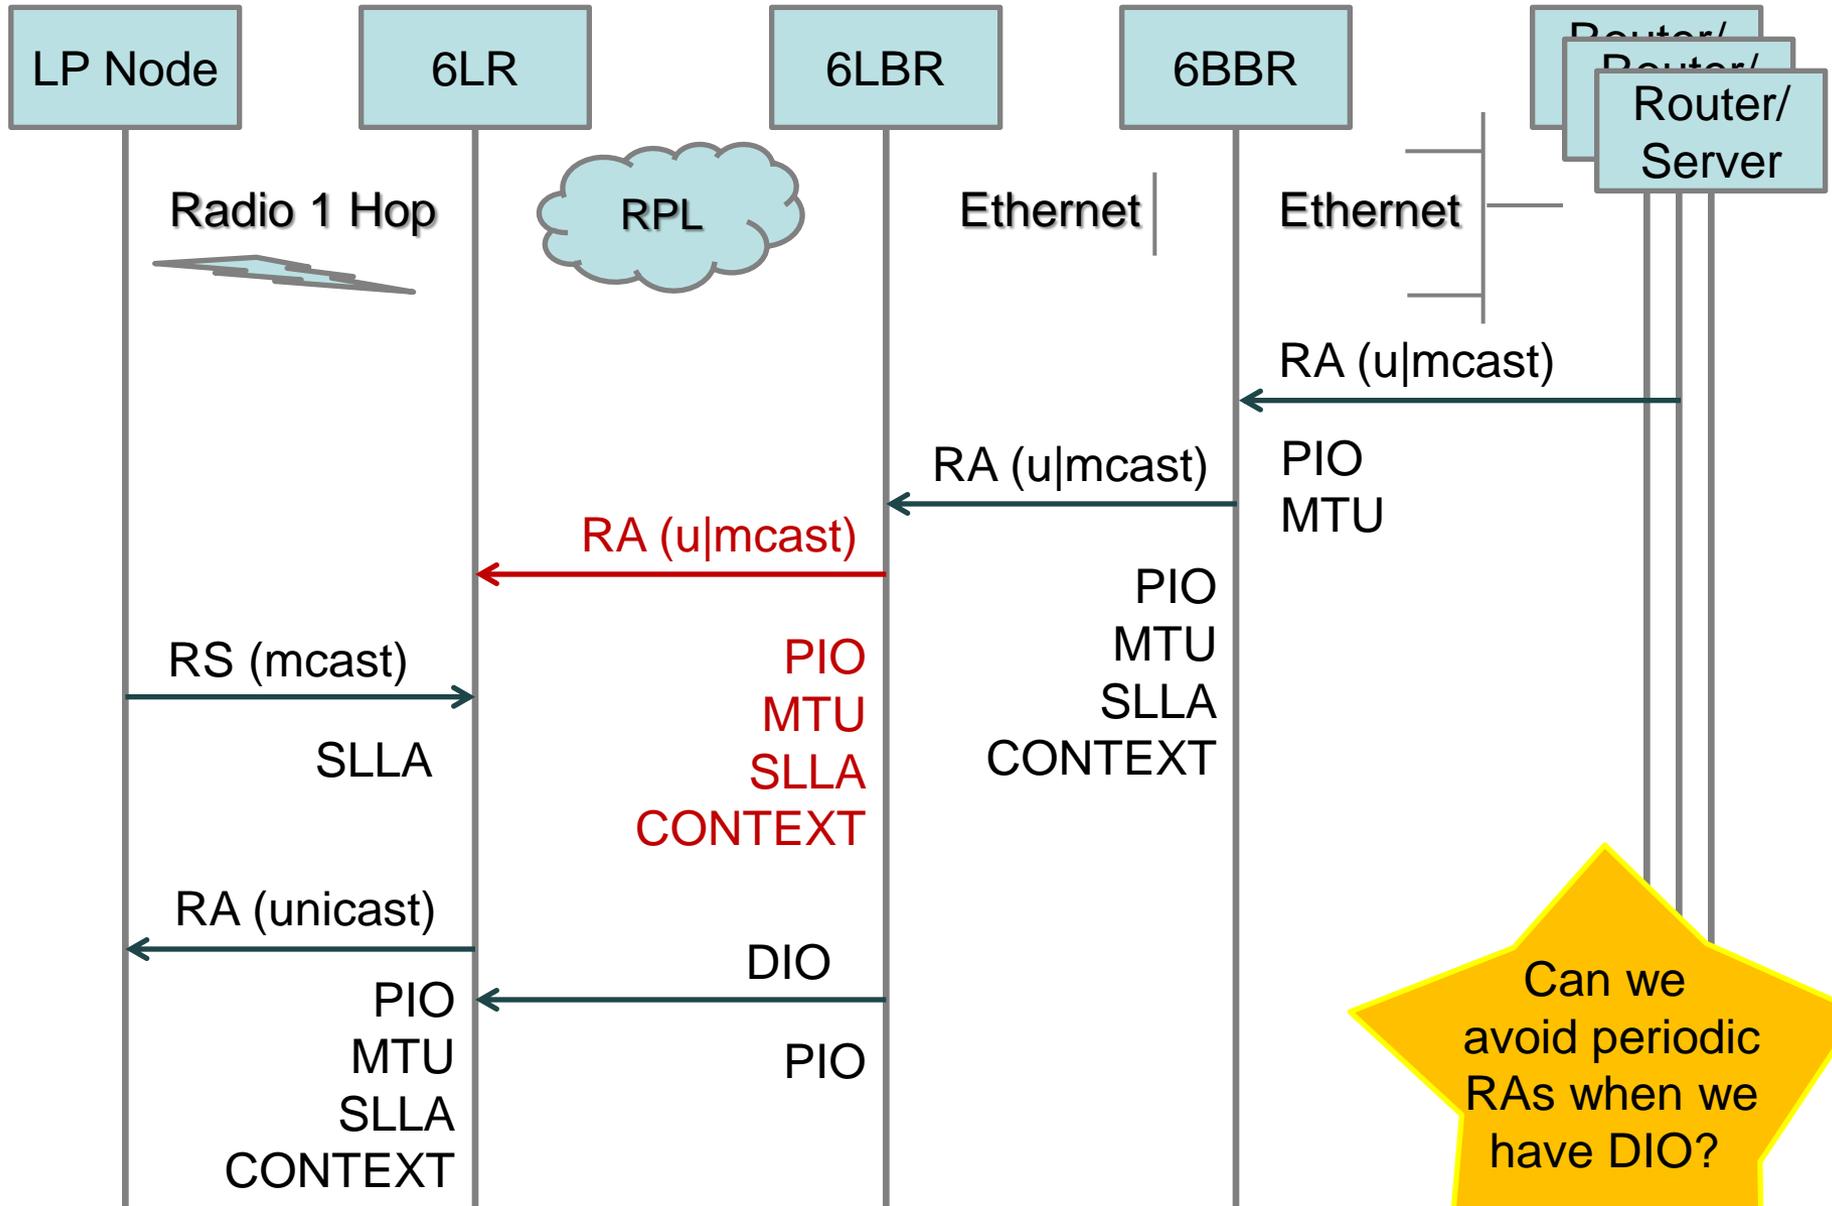

Thank you!

Normal registration

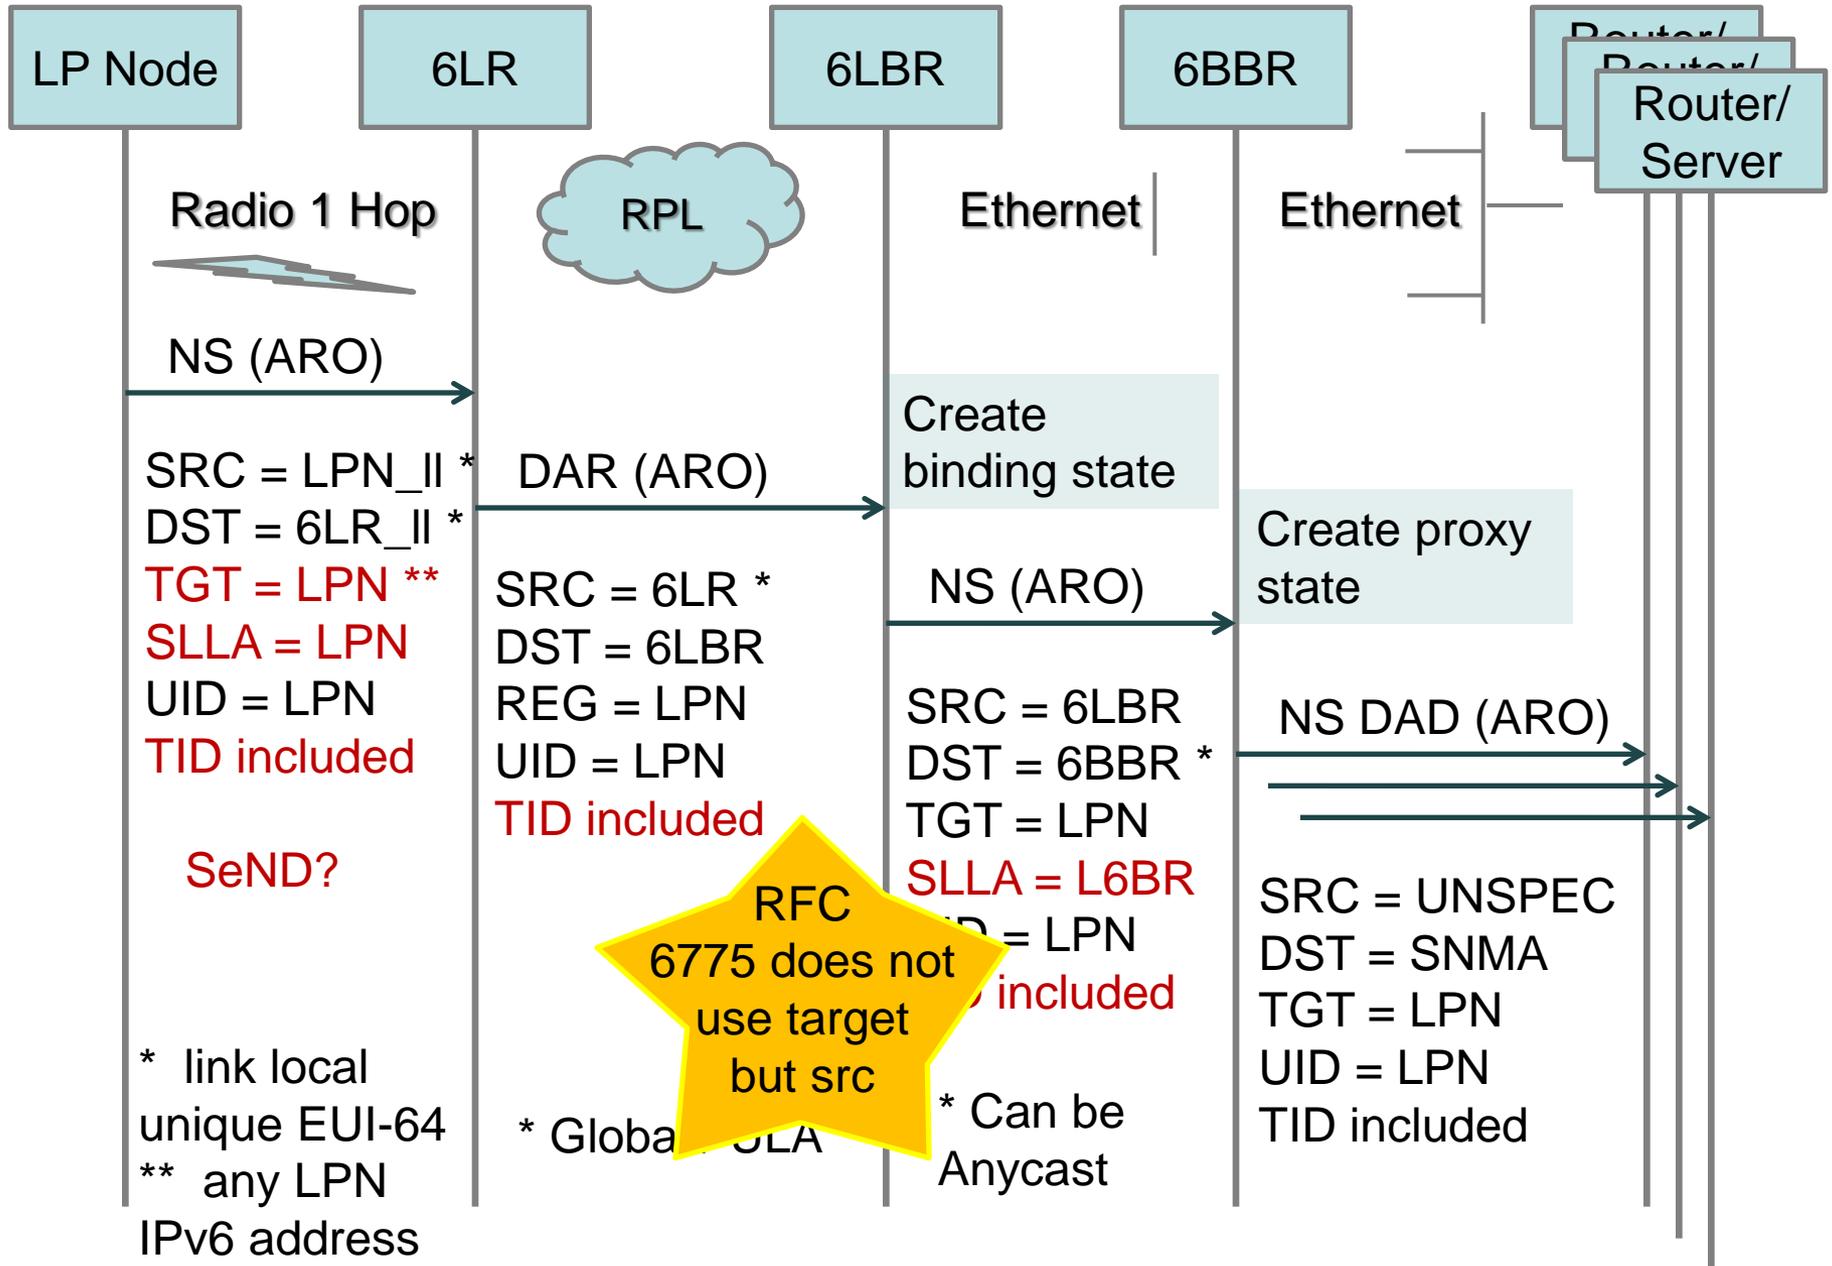

FLOWS IN FULL DISTRIBUTED MODE

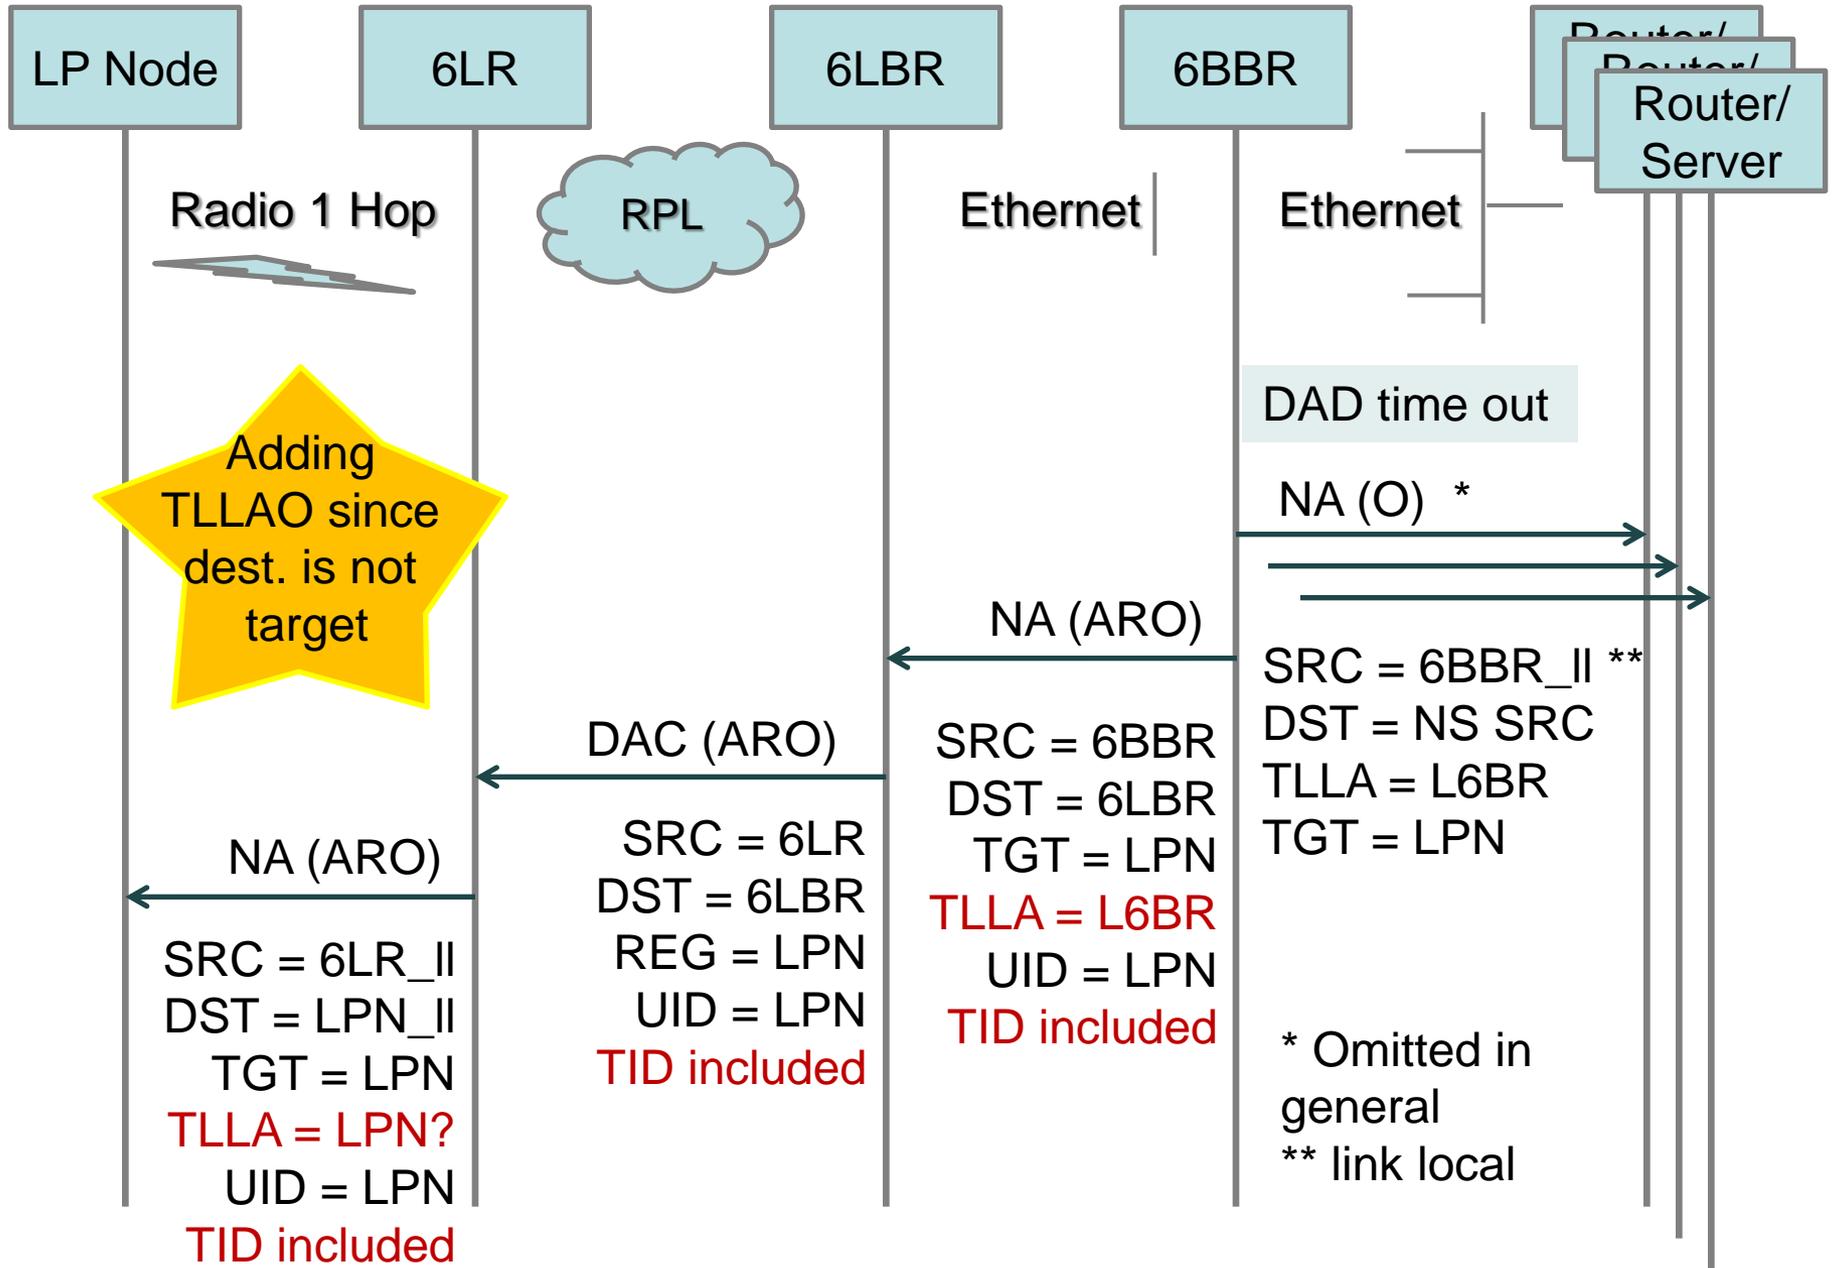

ML Subnet

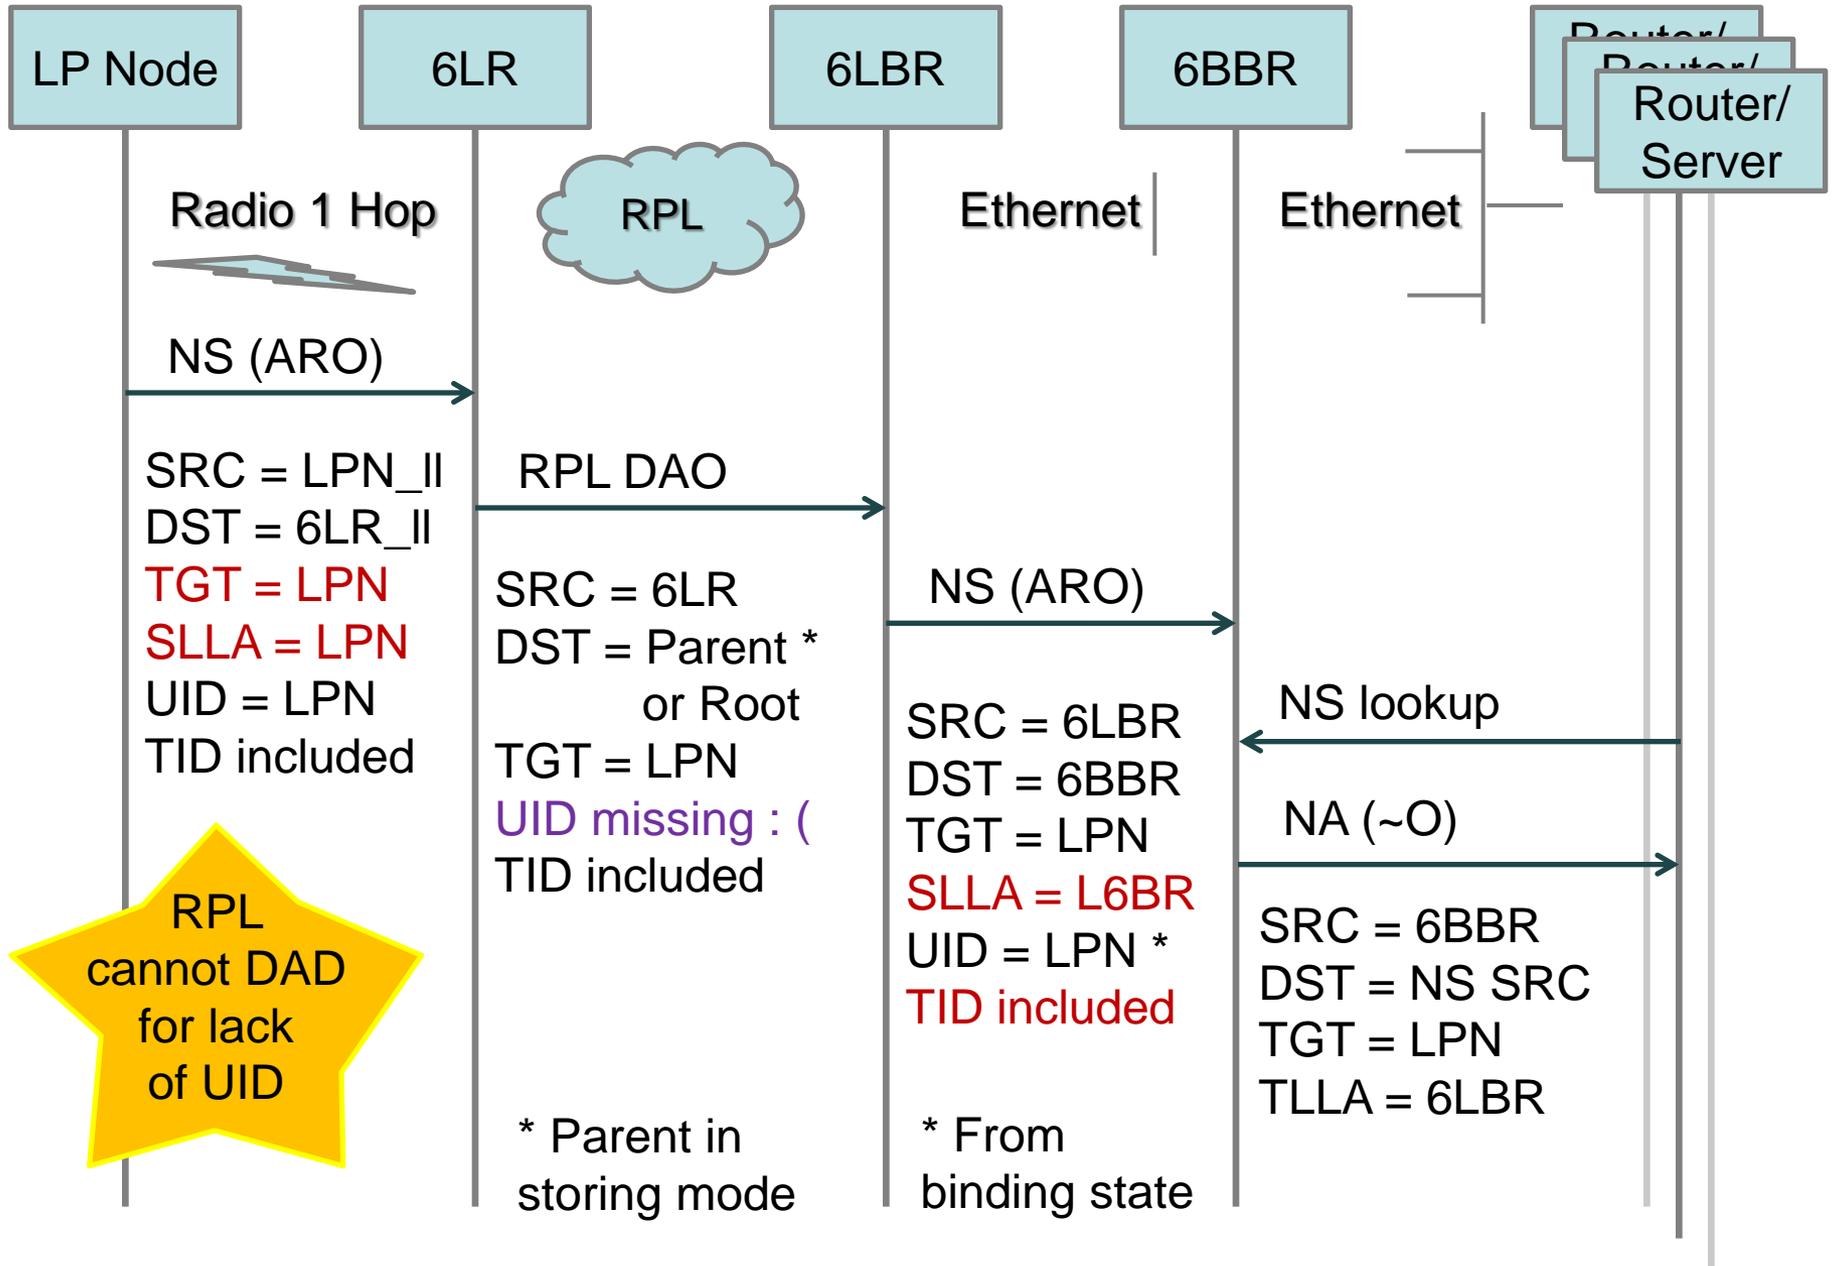

Can we avoid periodic RAs when we have DIO?

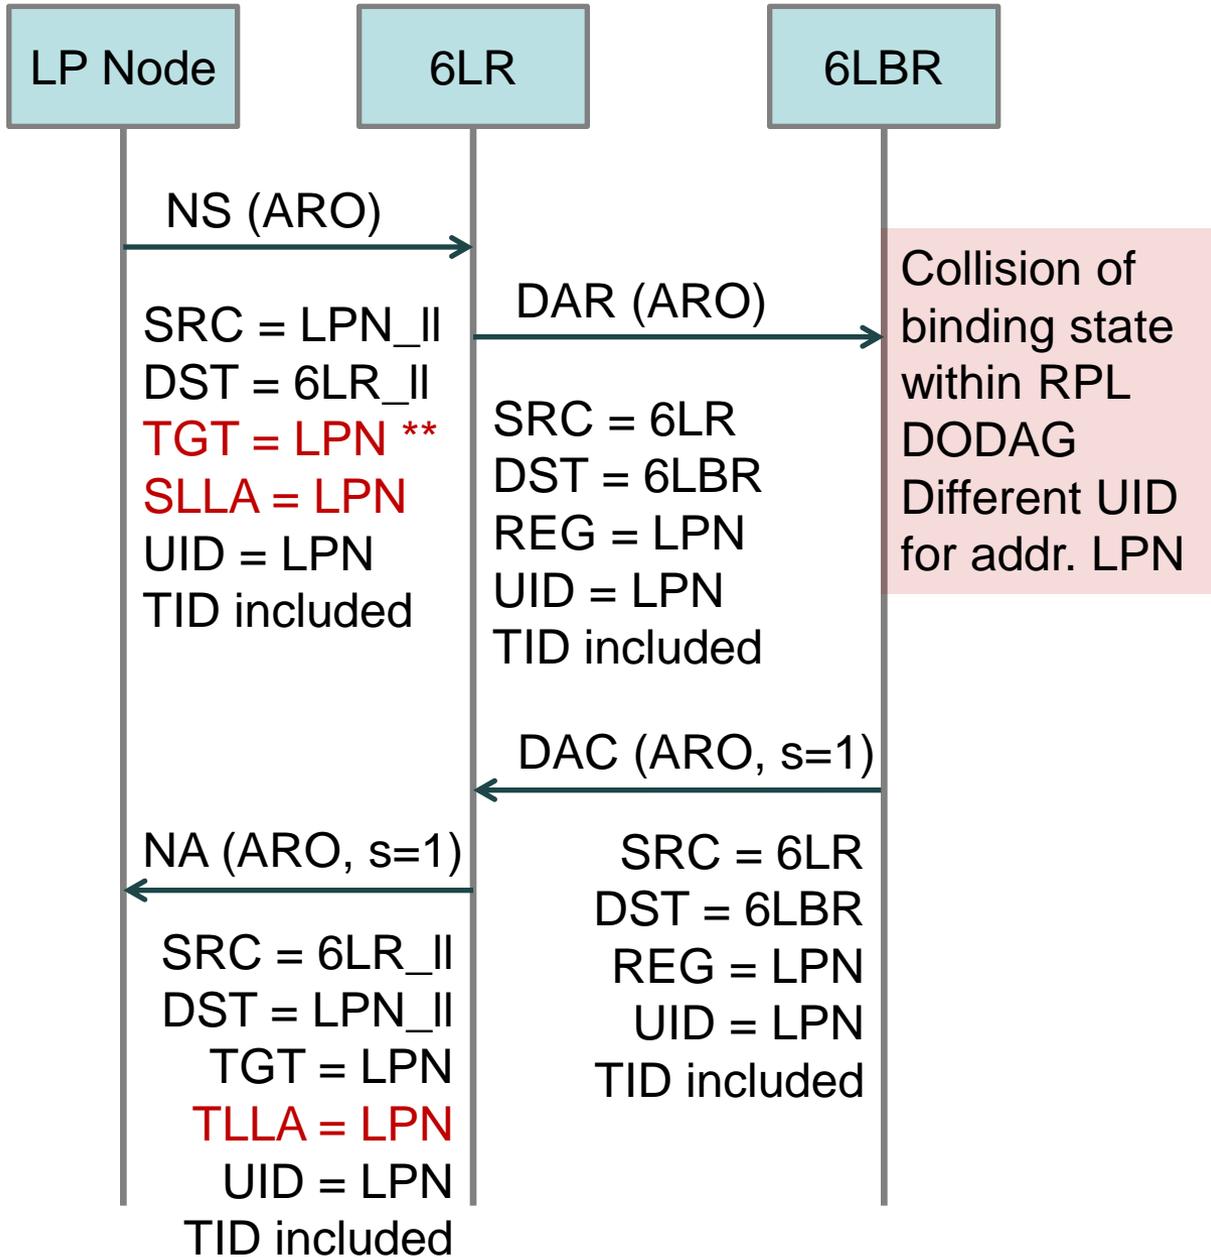

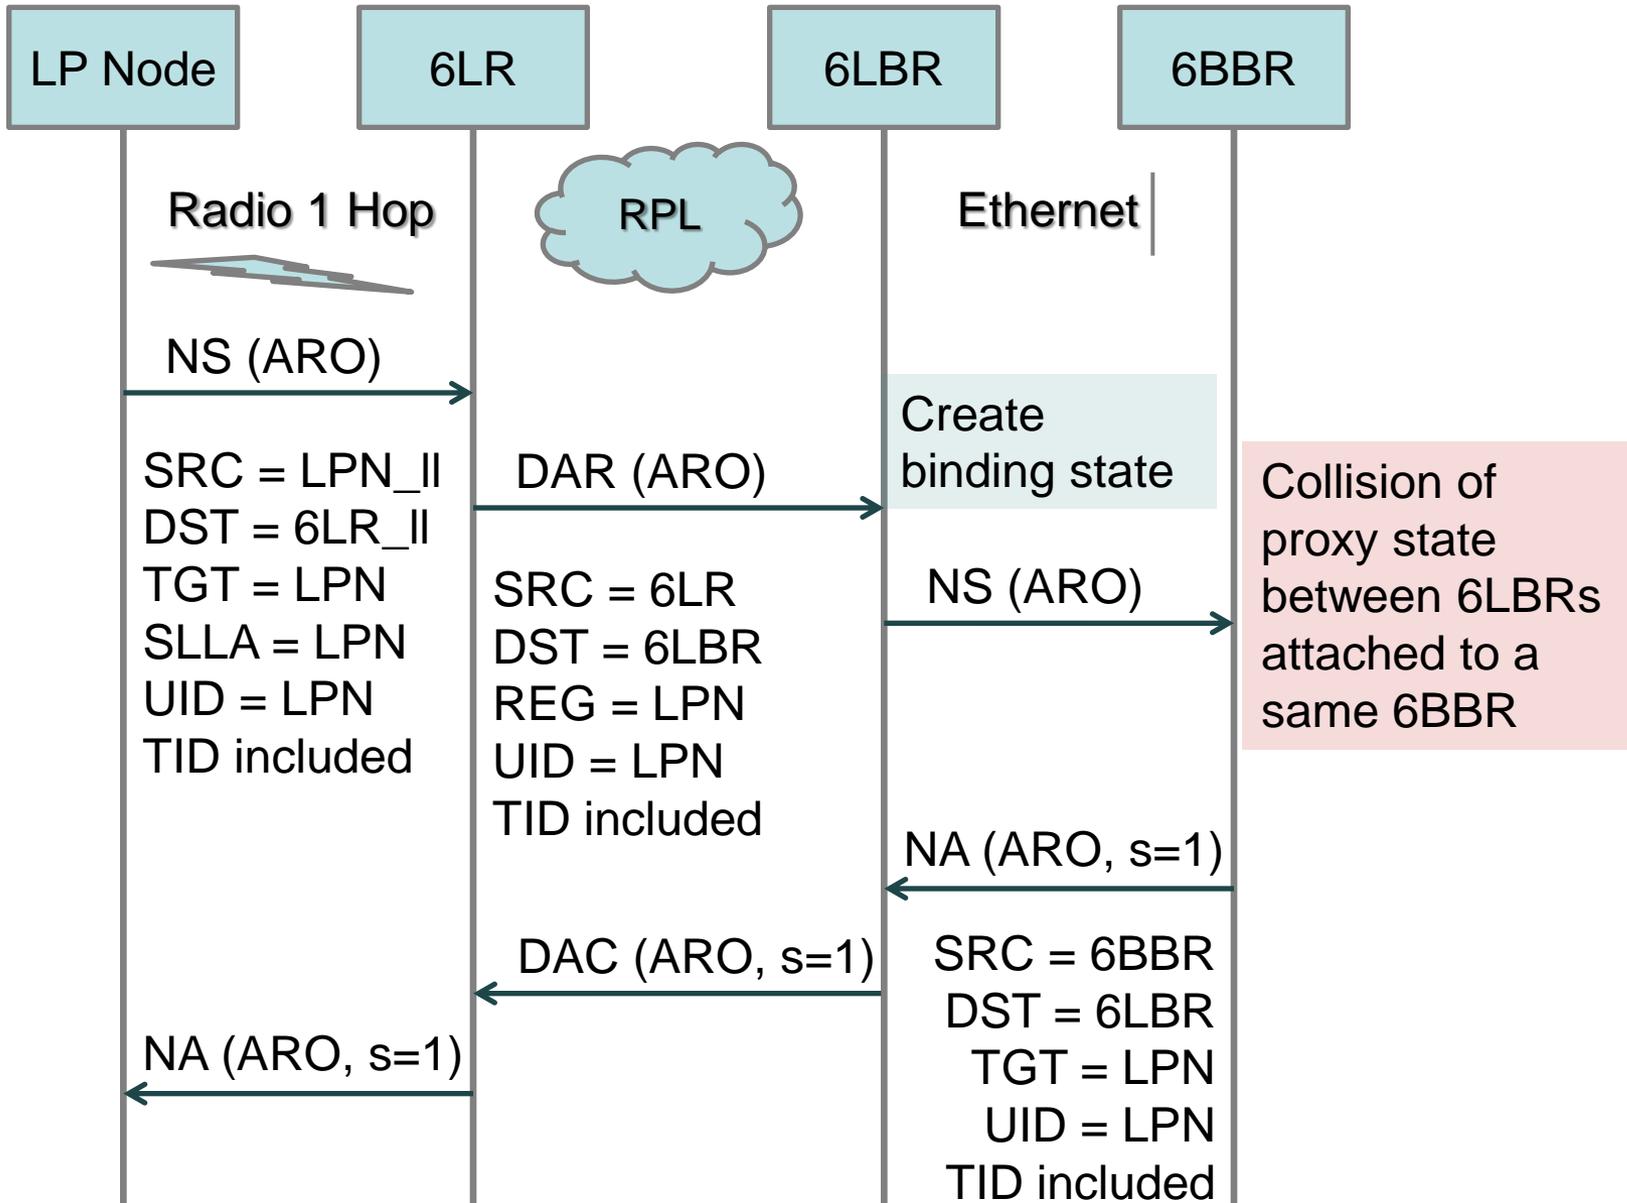

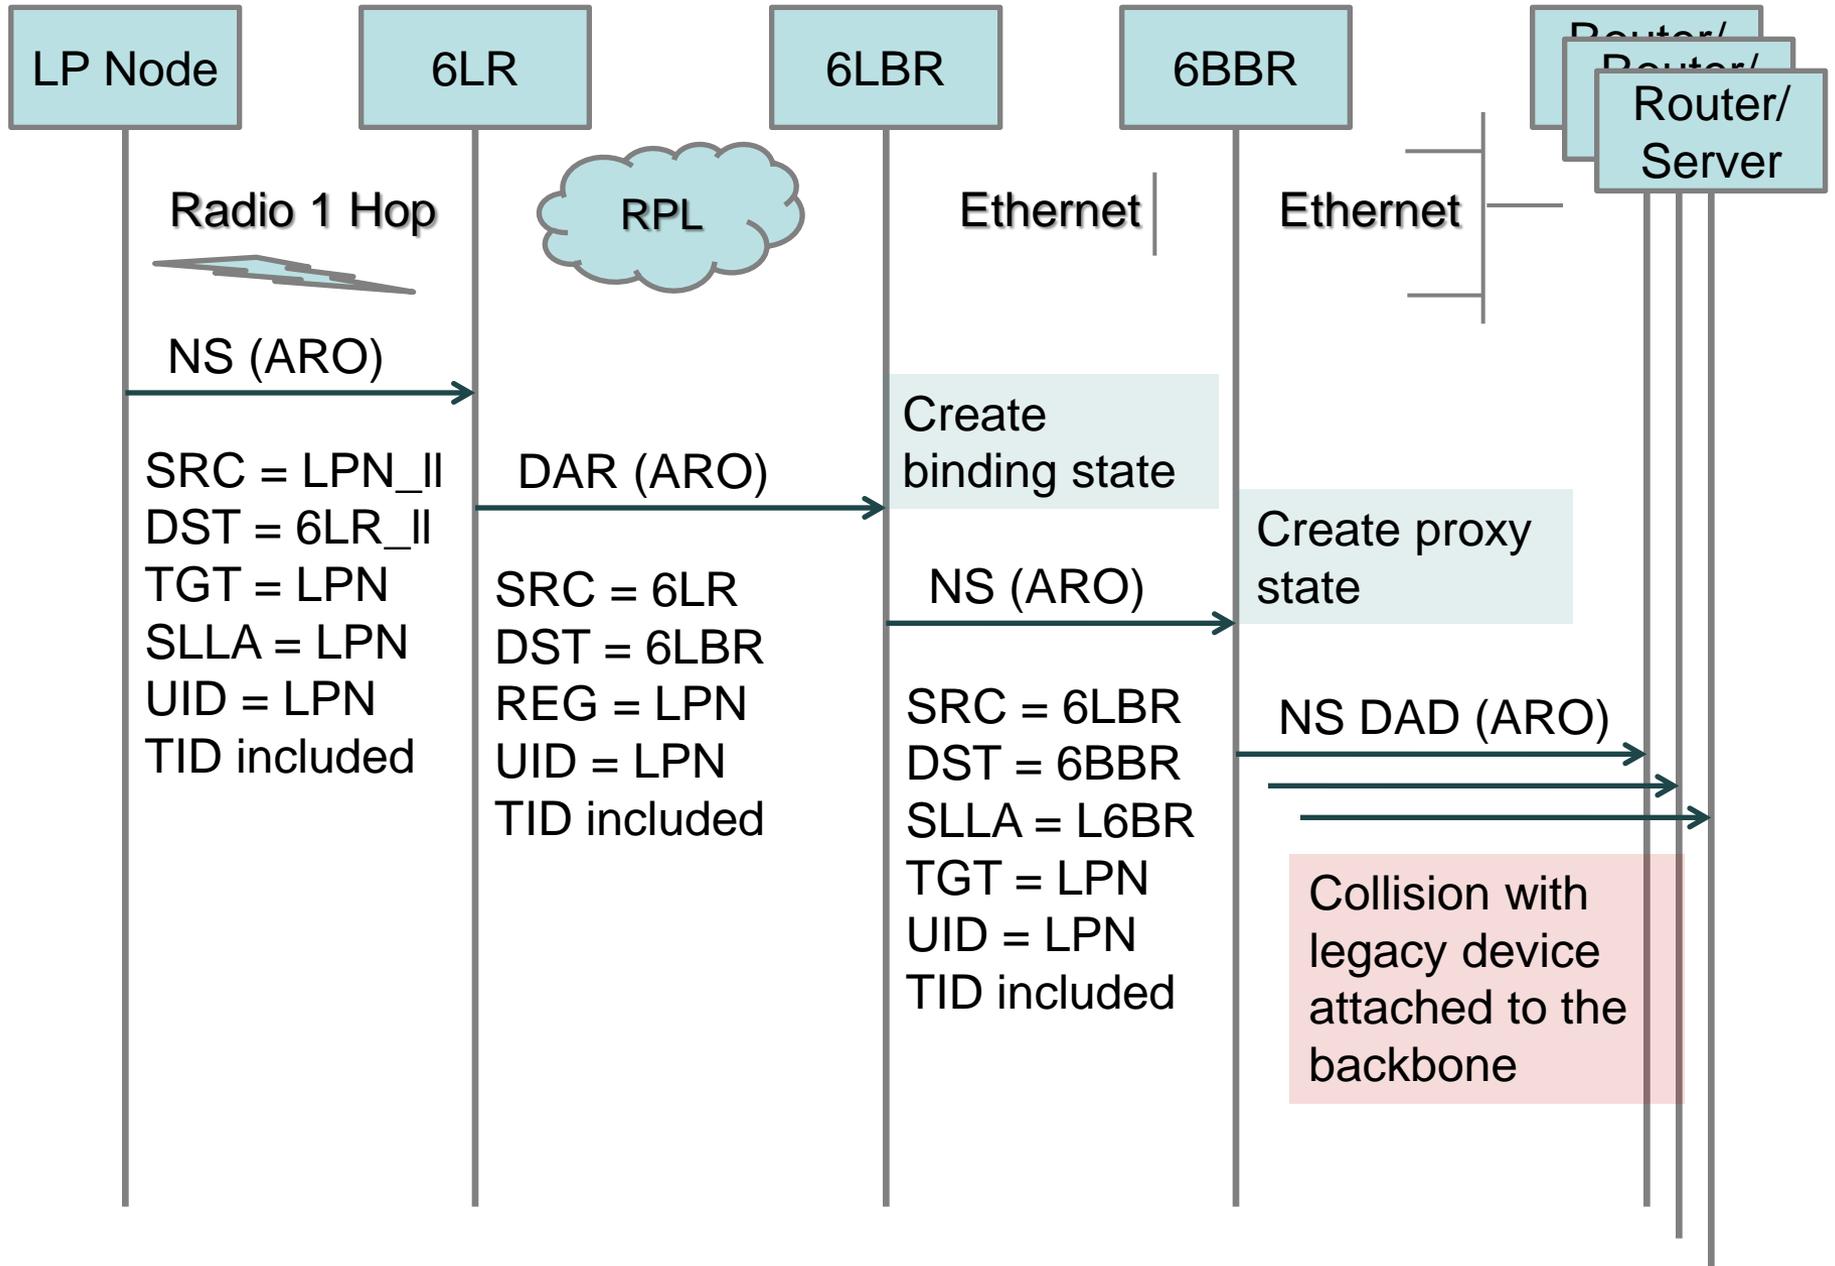

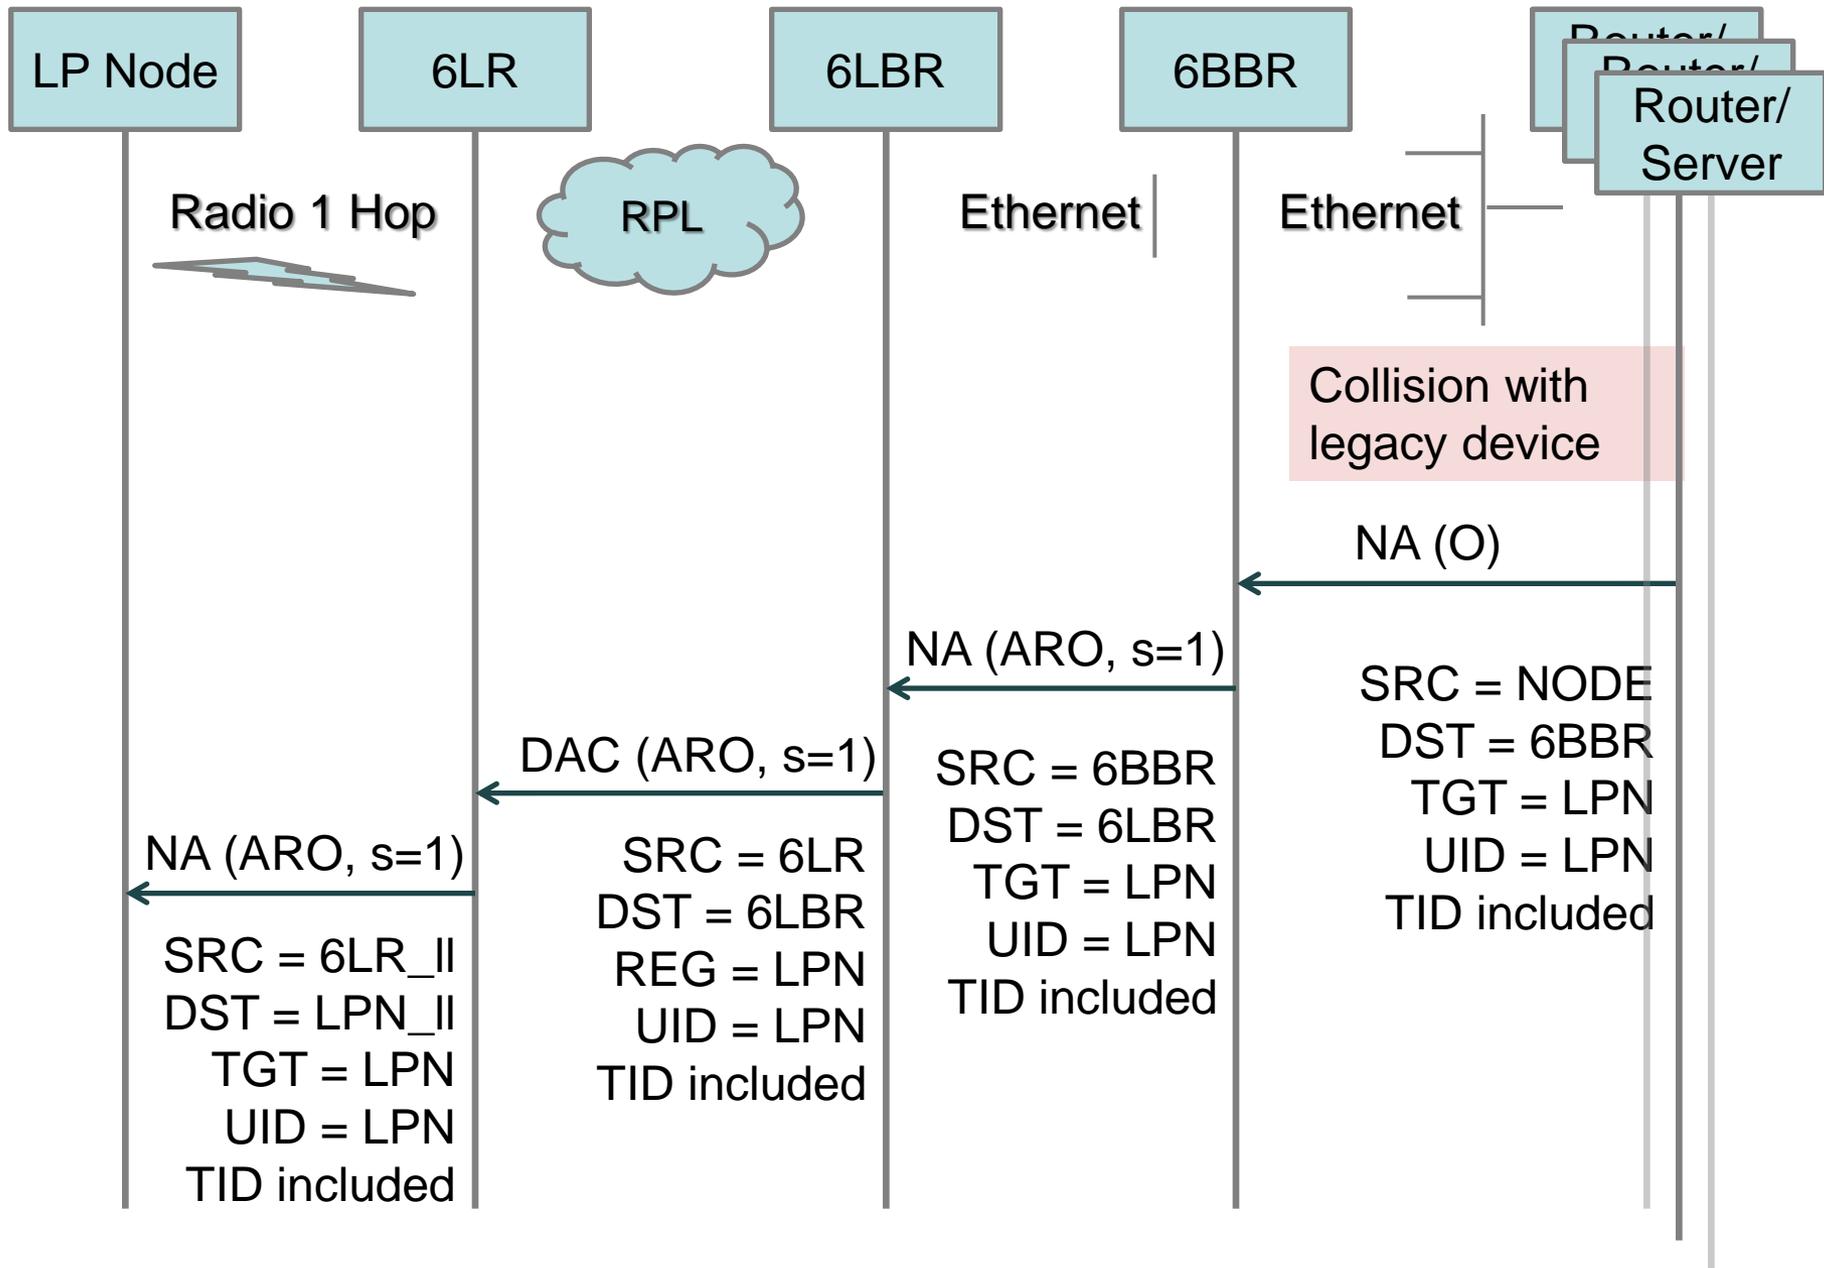

Duplicate registration

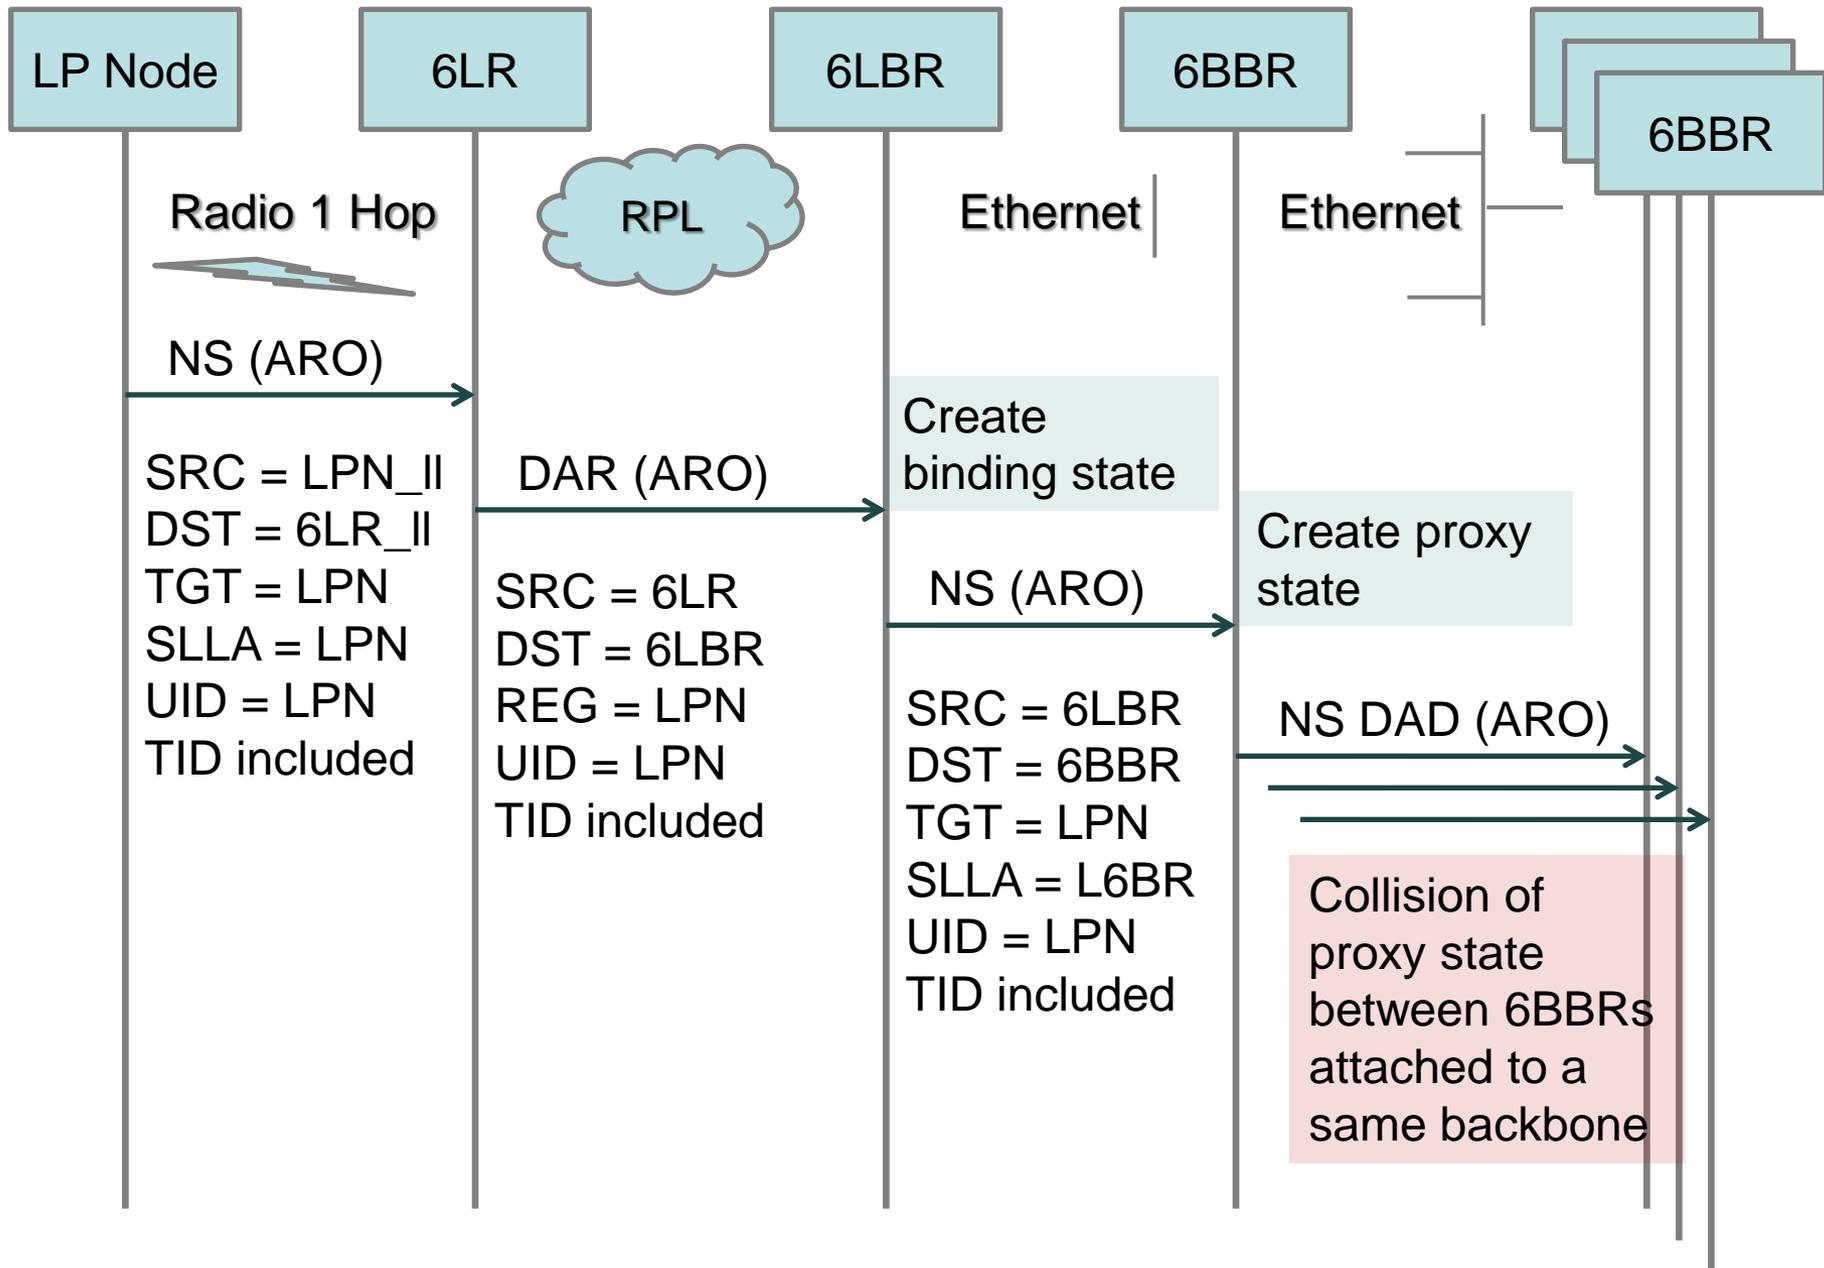

FLOWS IN FULL DISTRIBUTED MODE

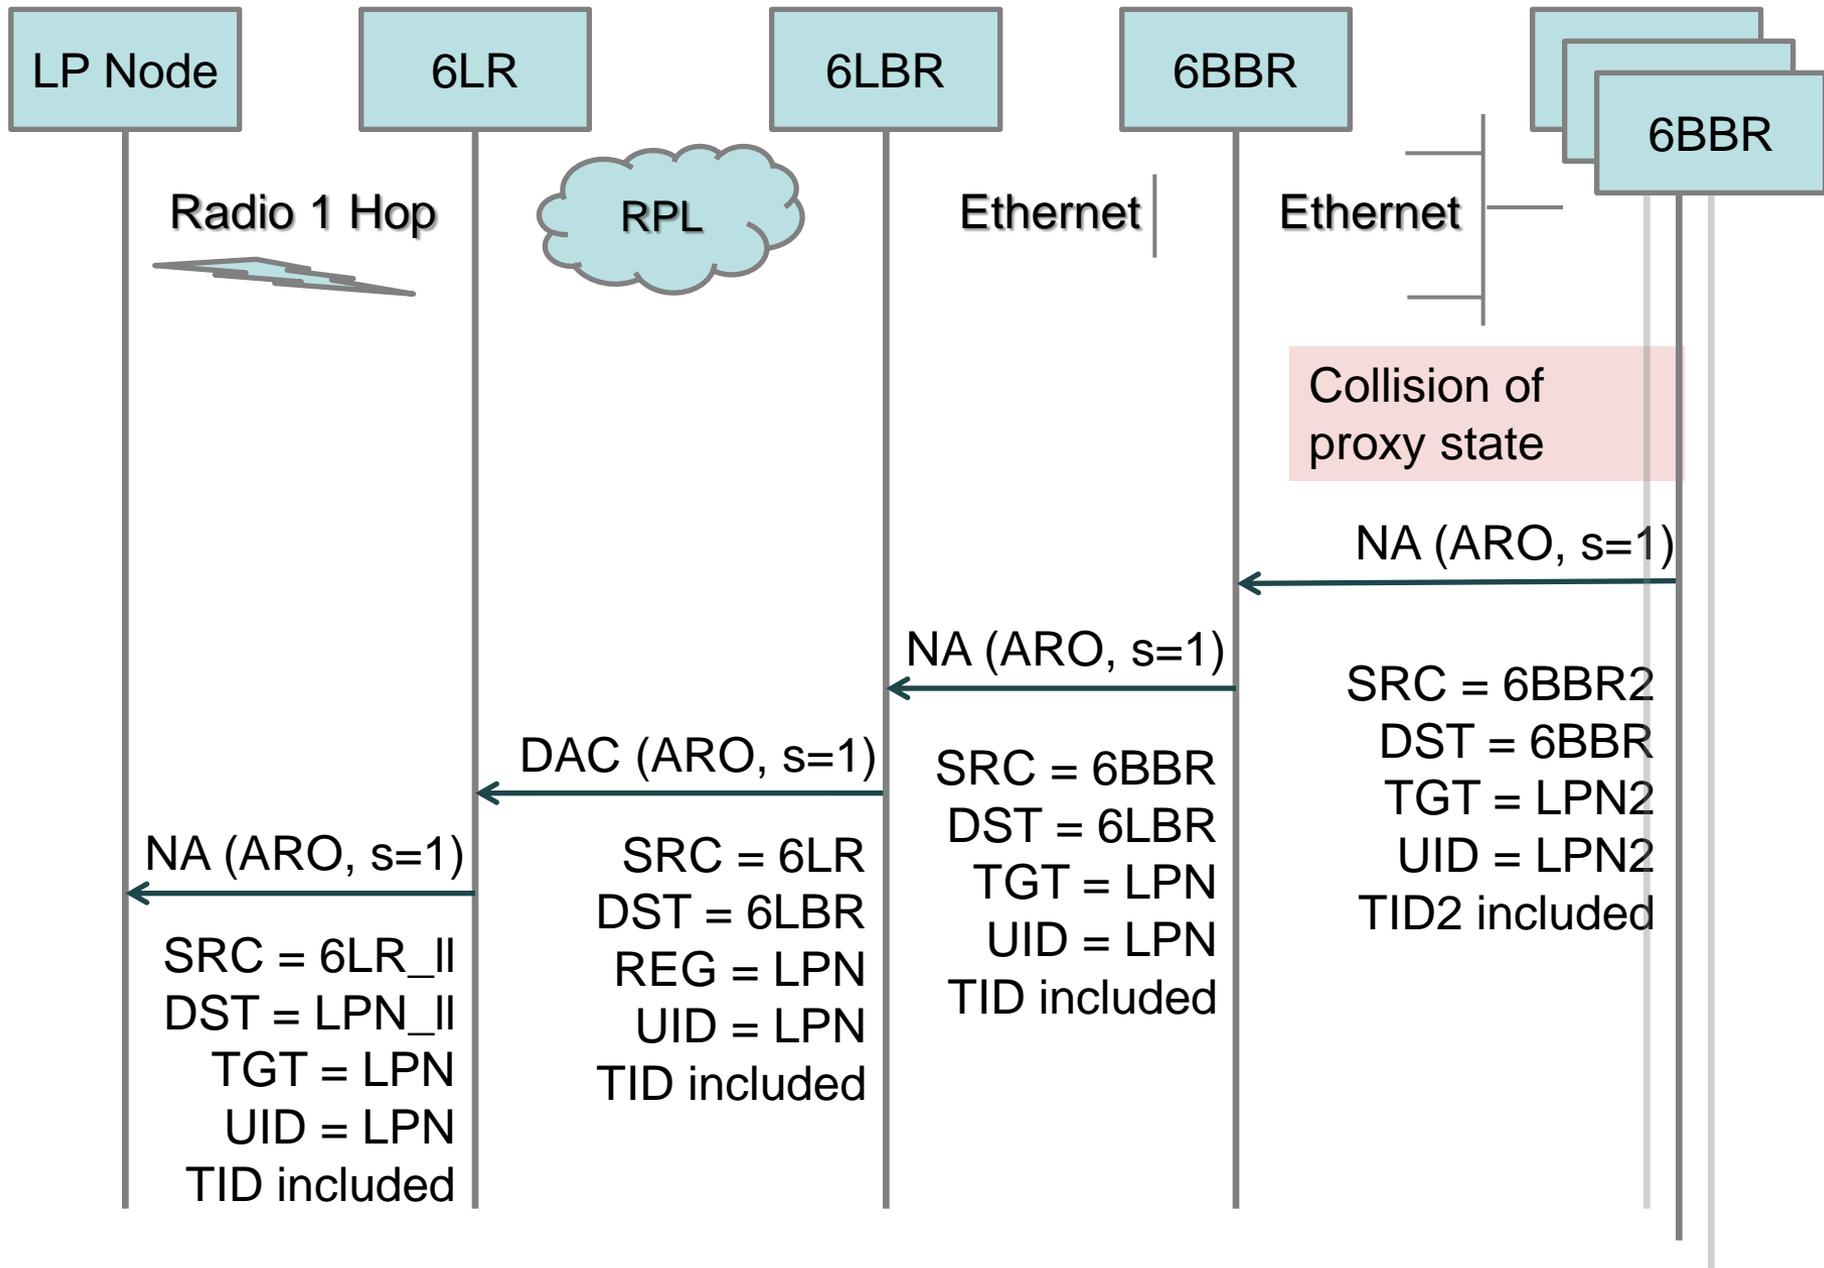

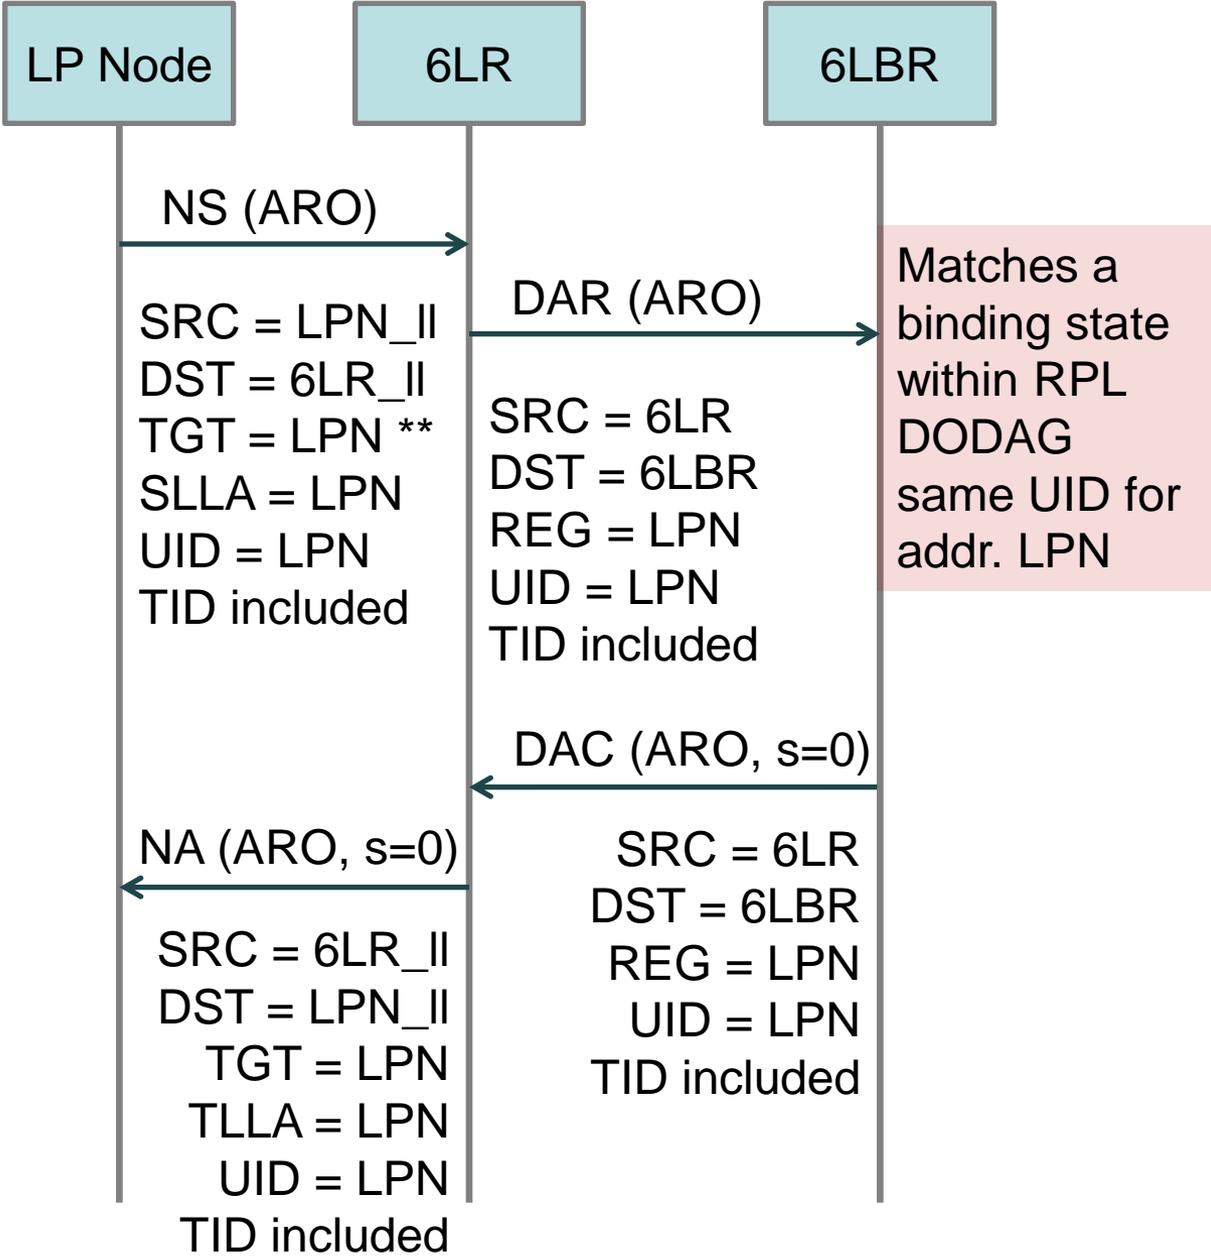

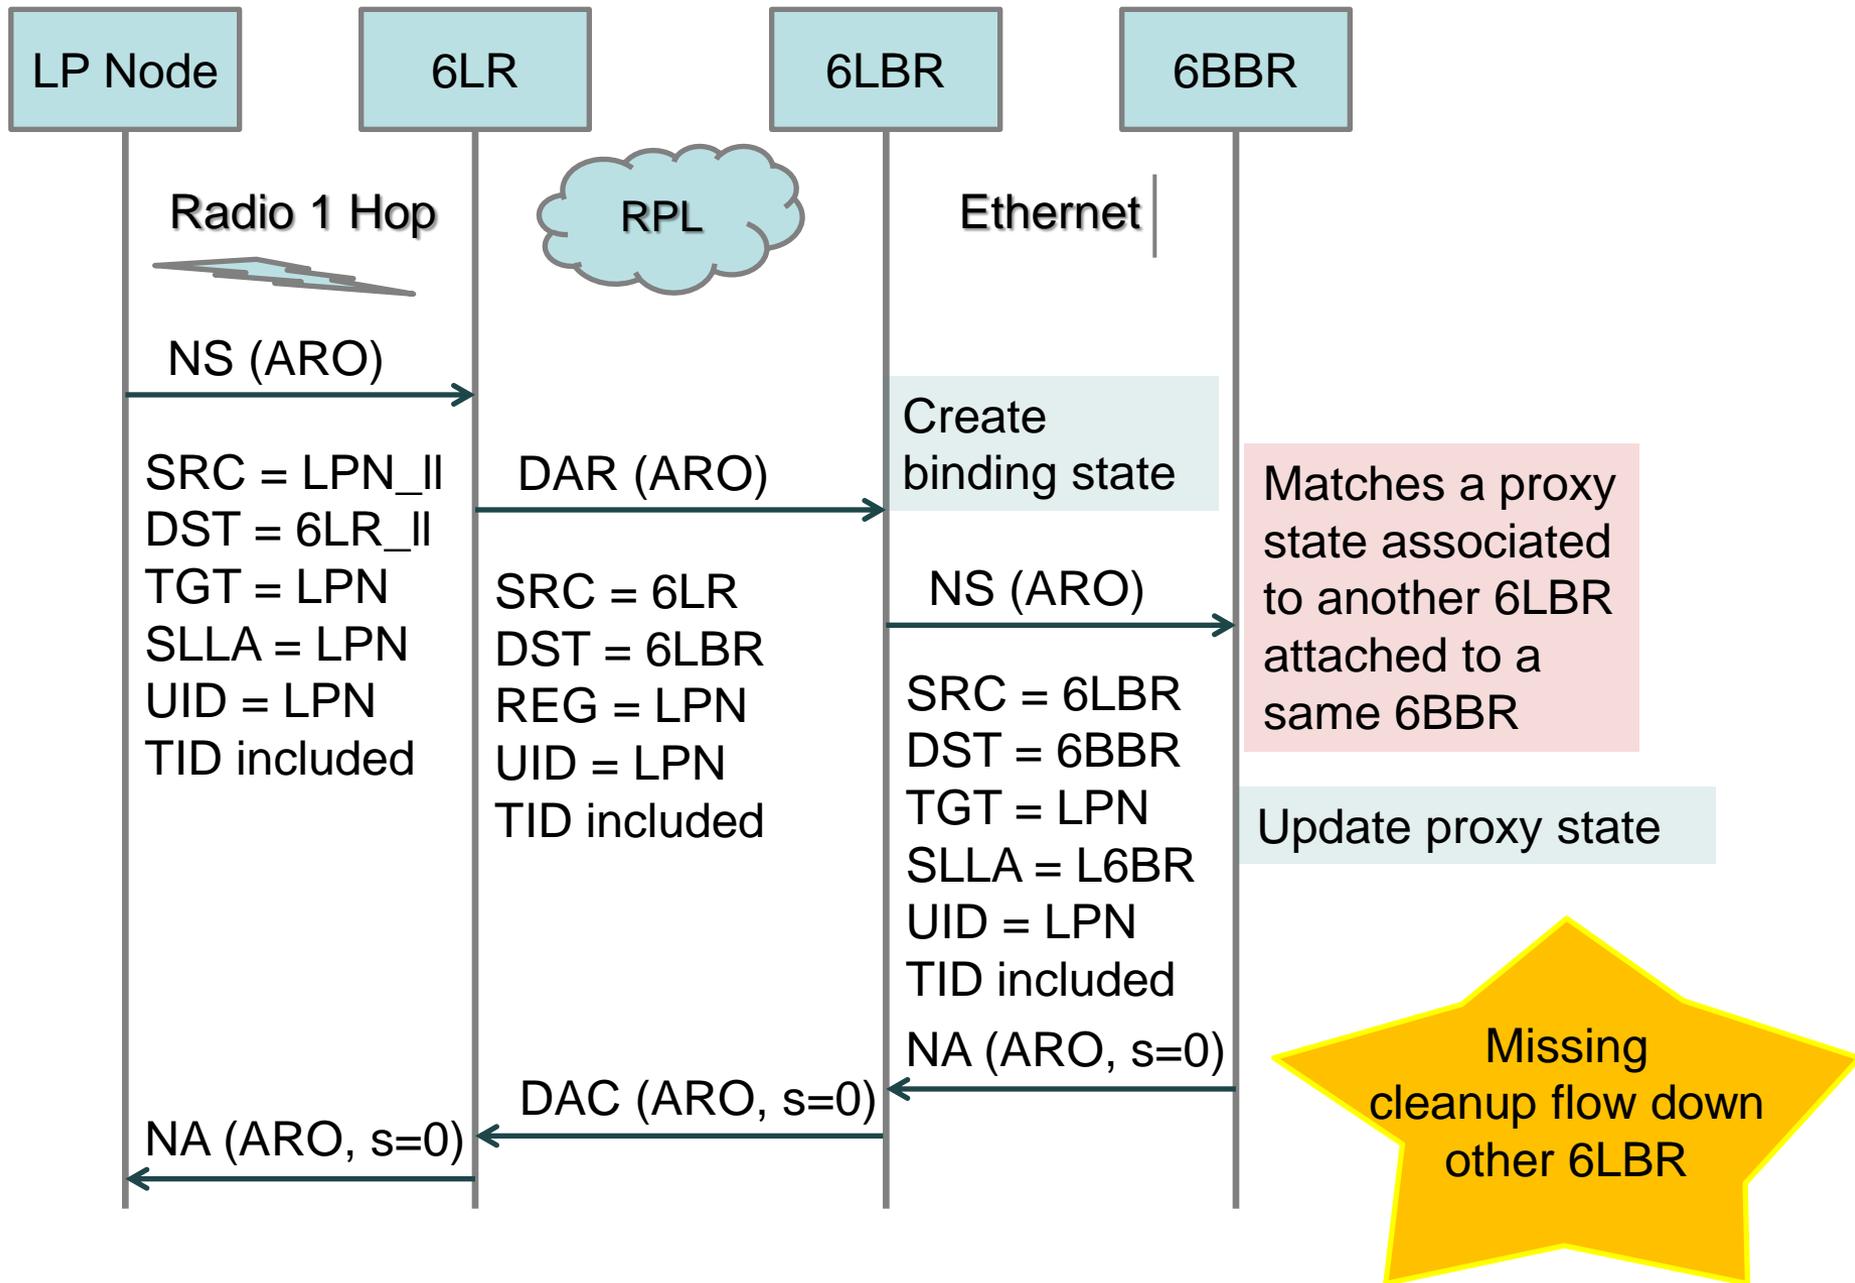

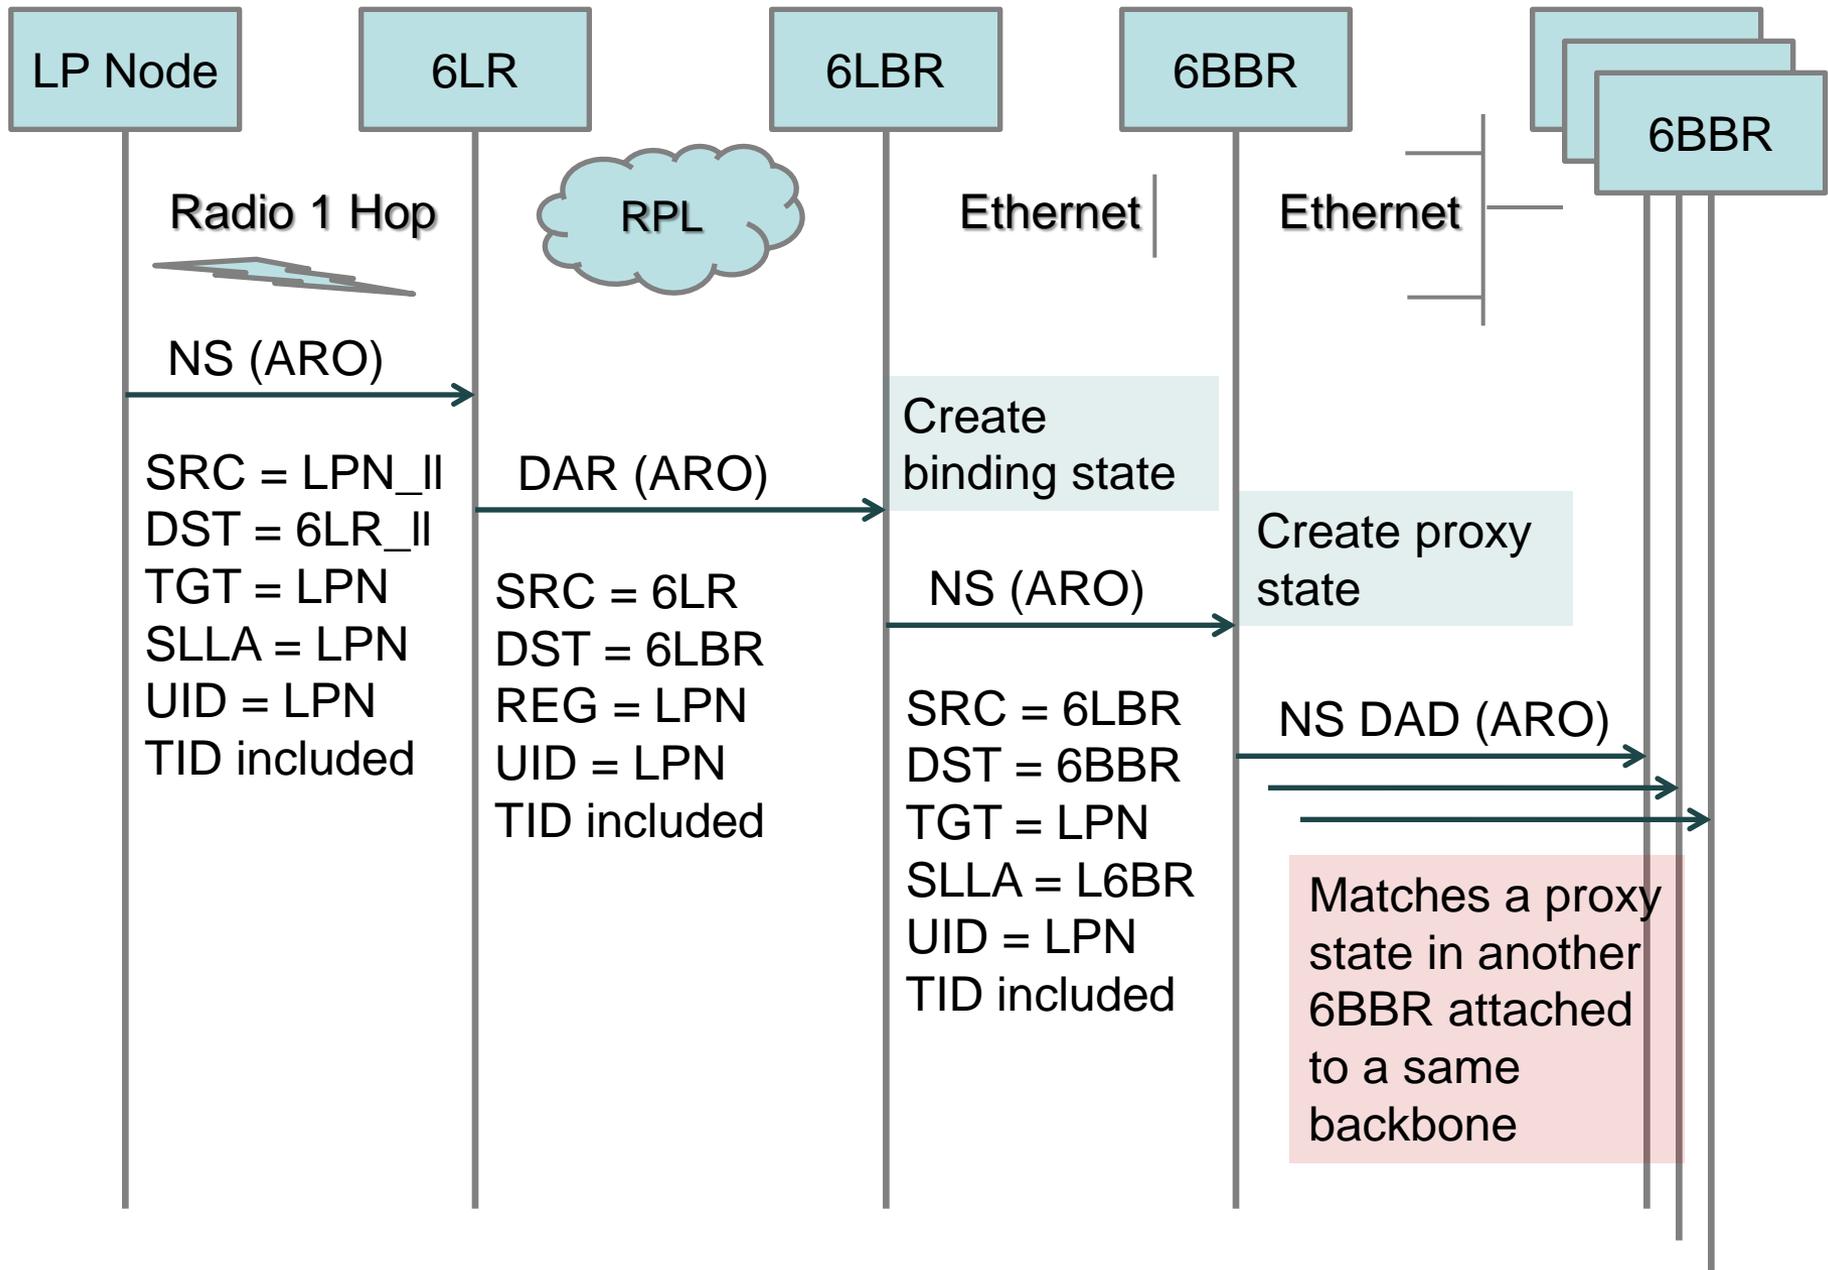

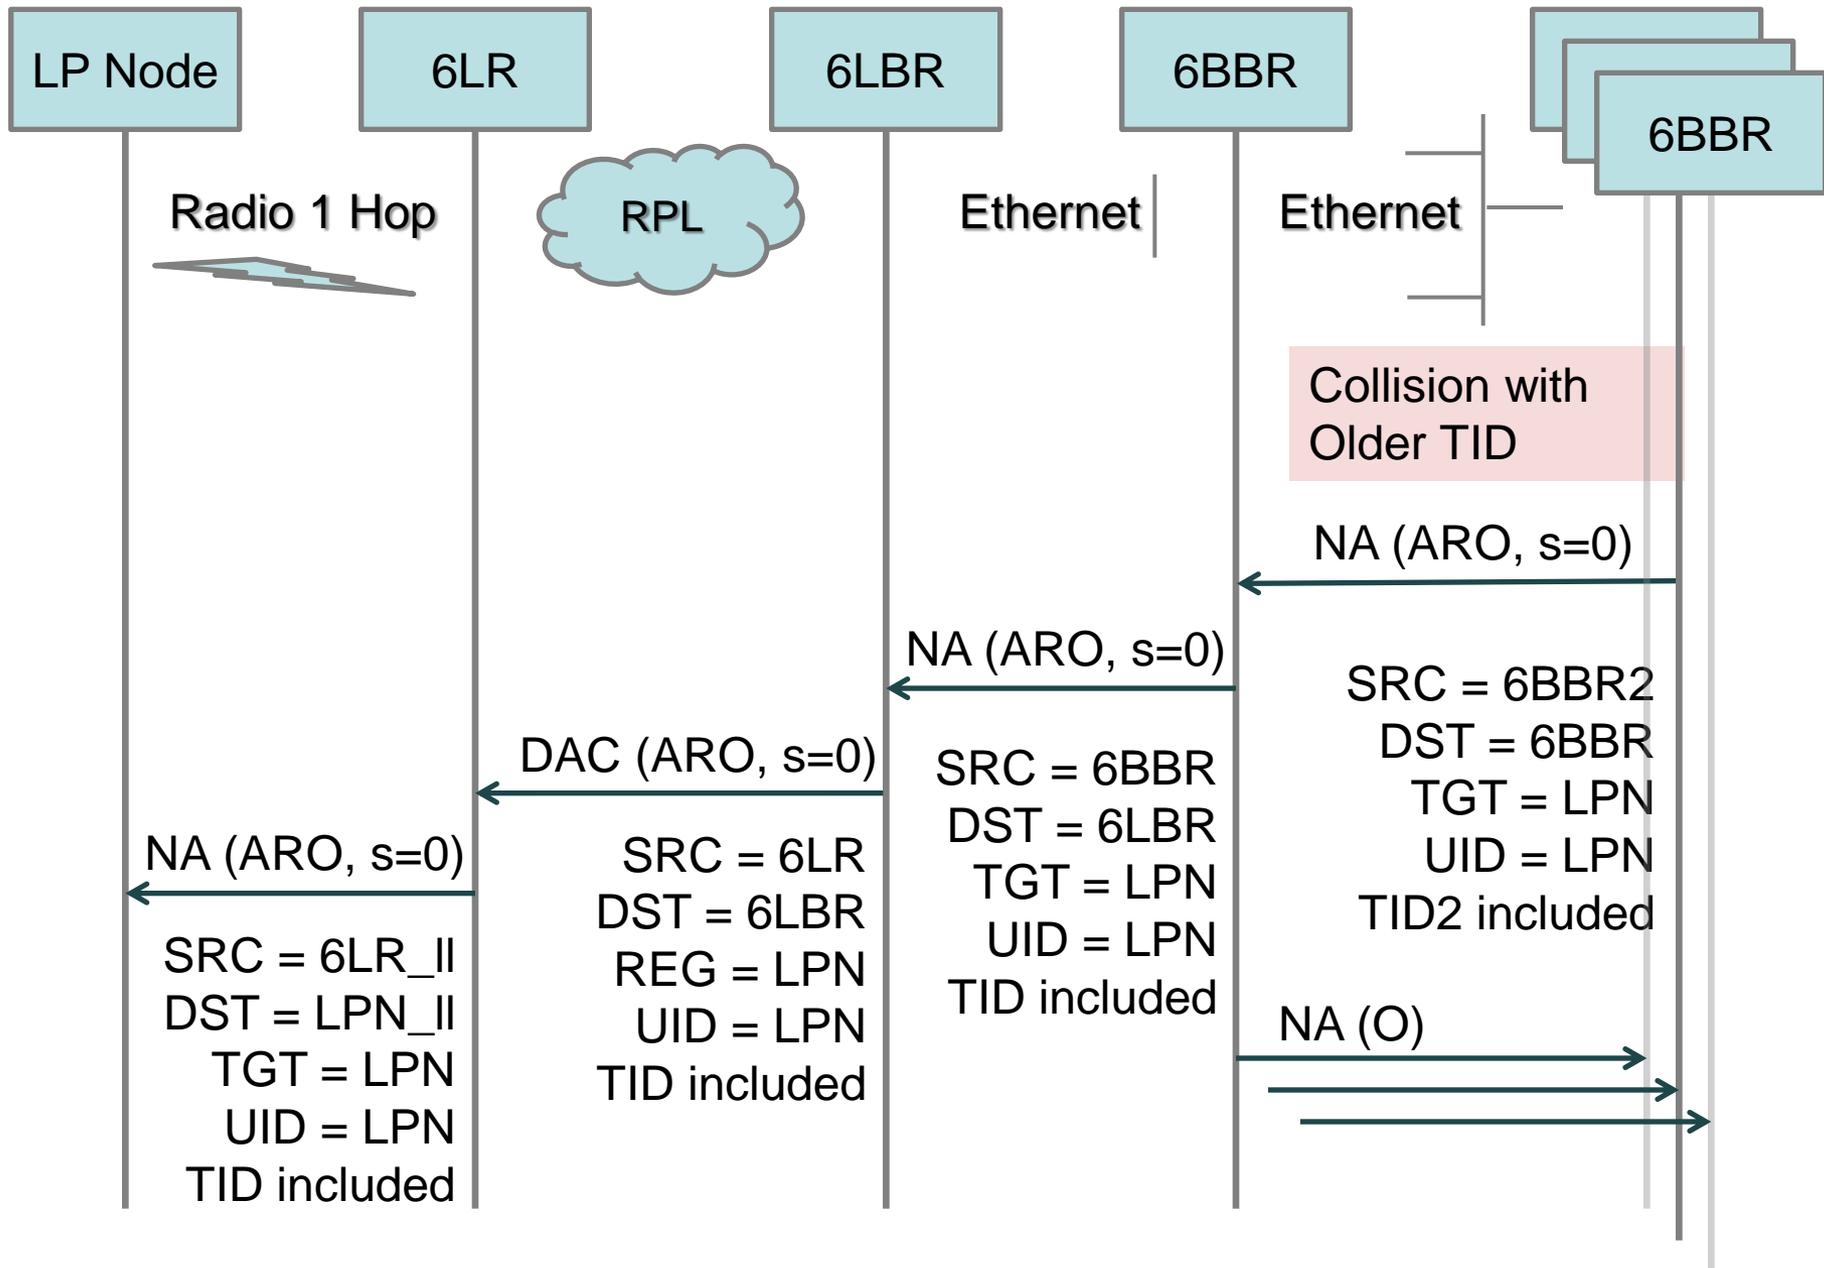

Movements

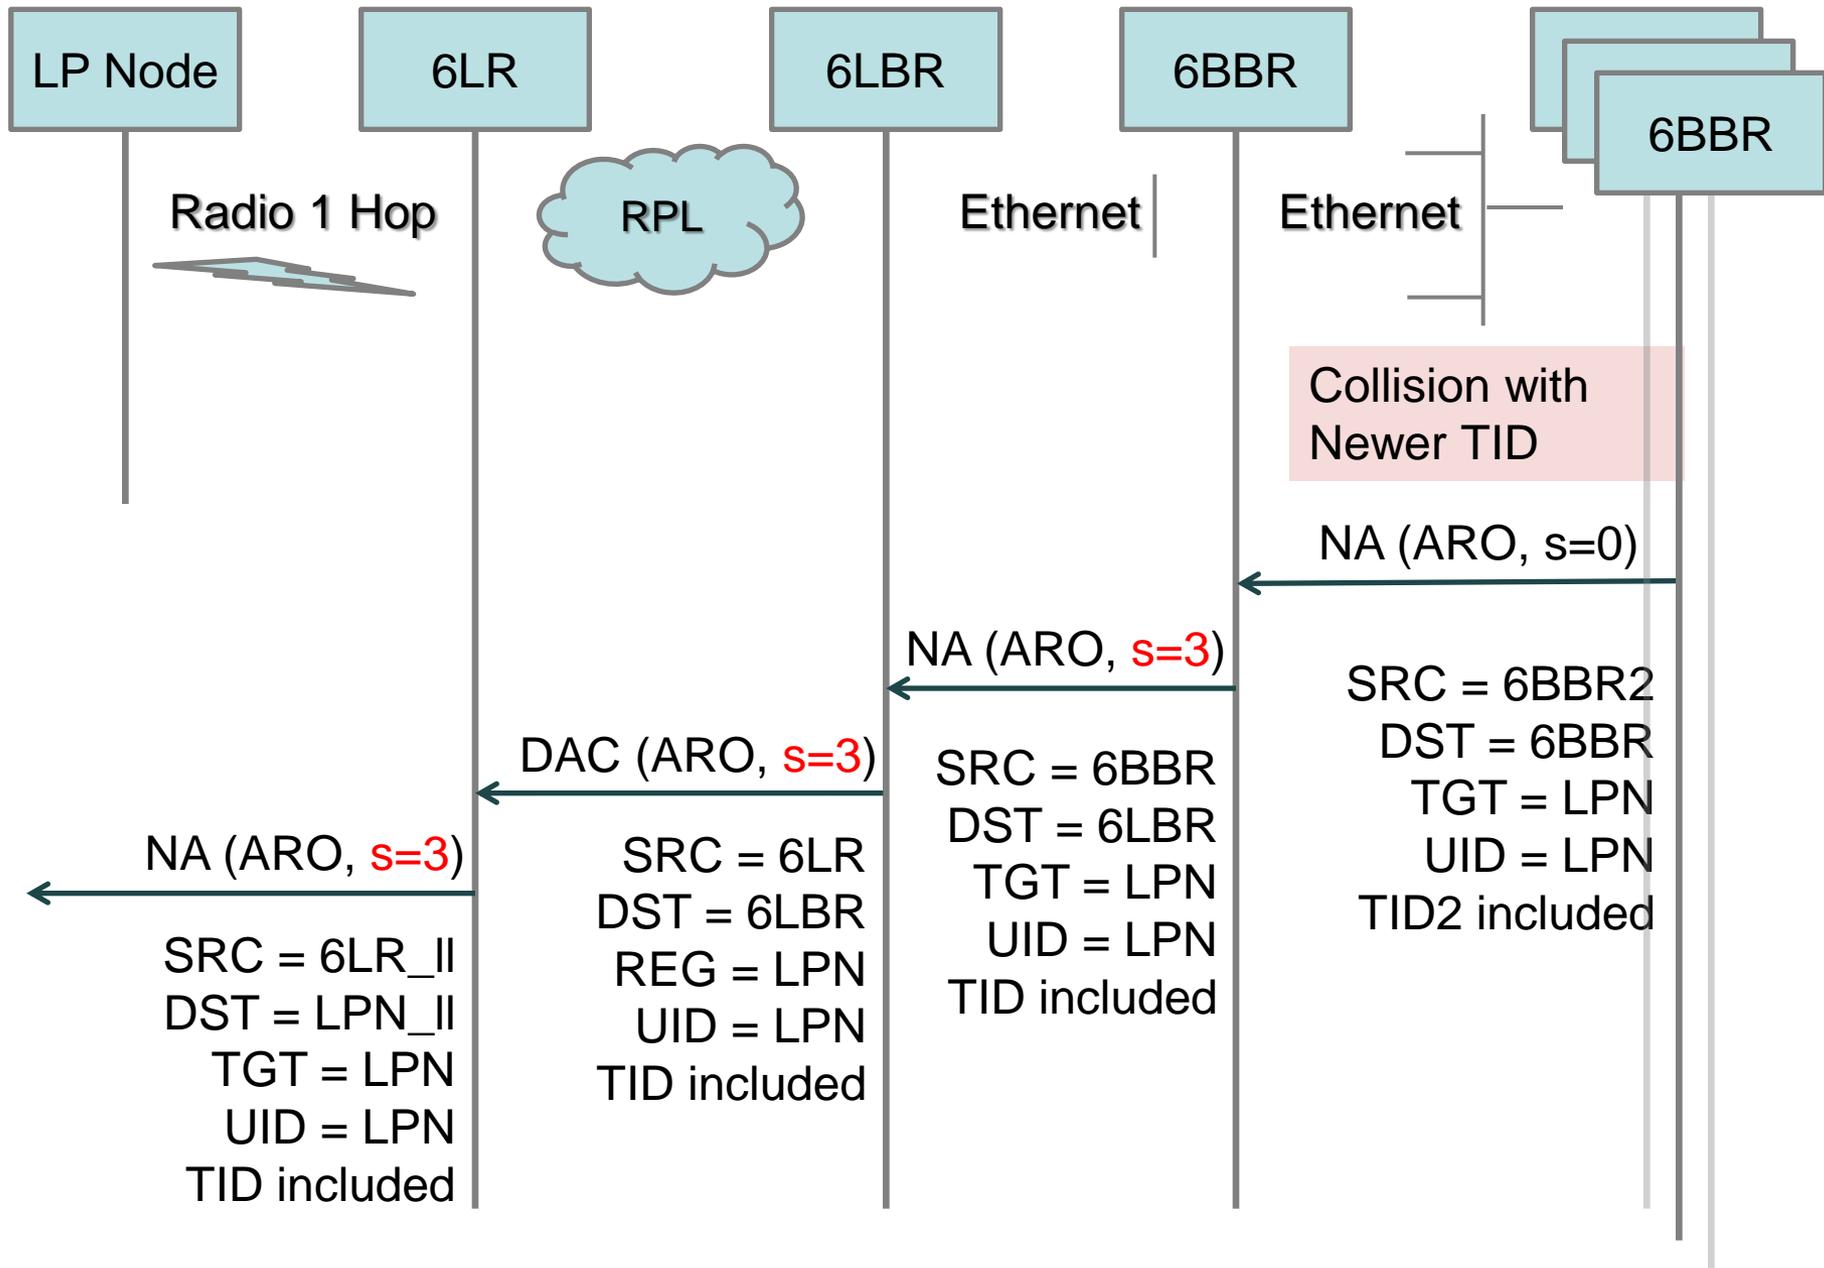

FLOWS IN FULL DISTRIBUTED MODE

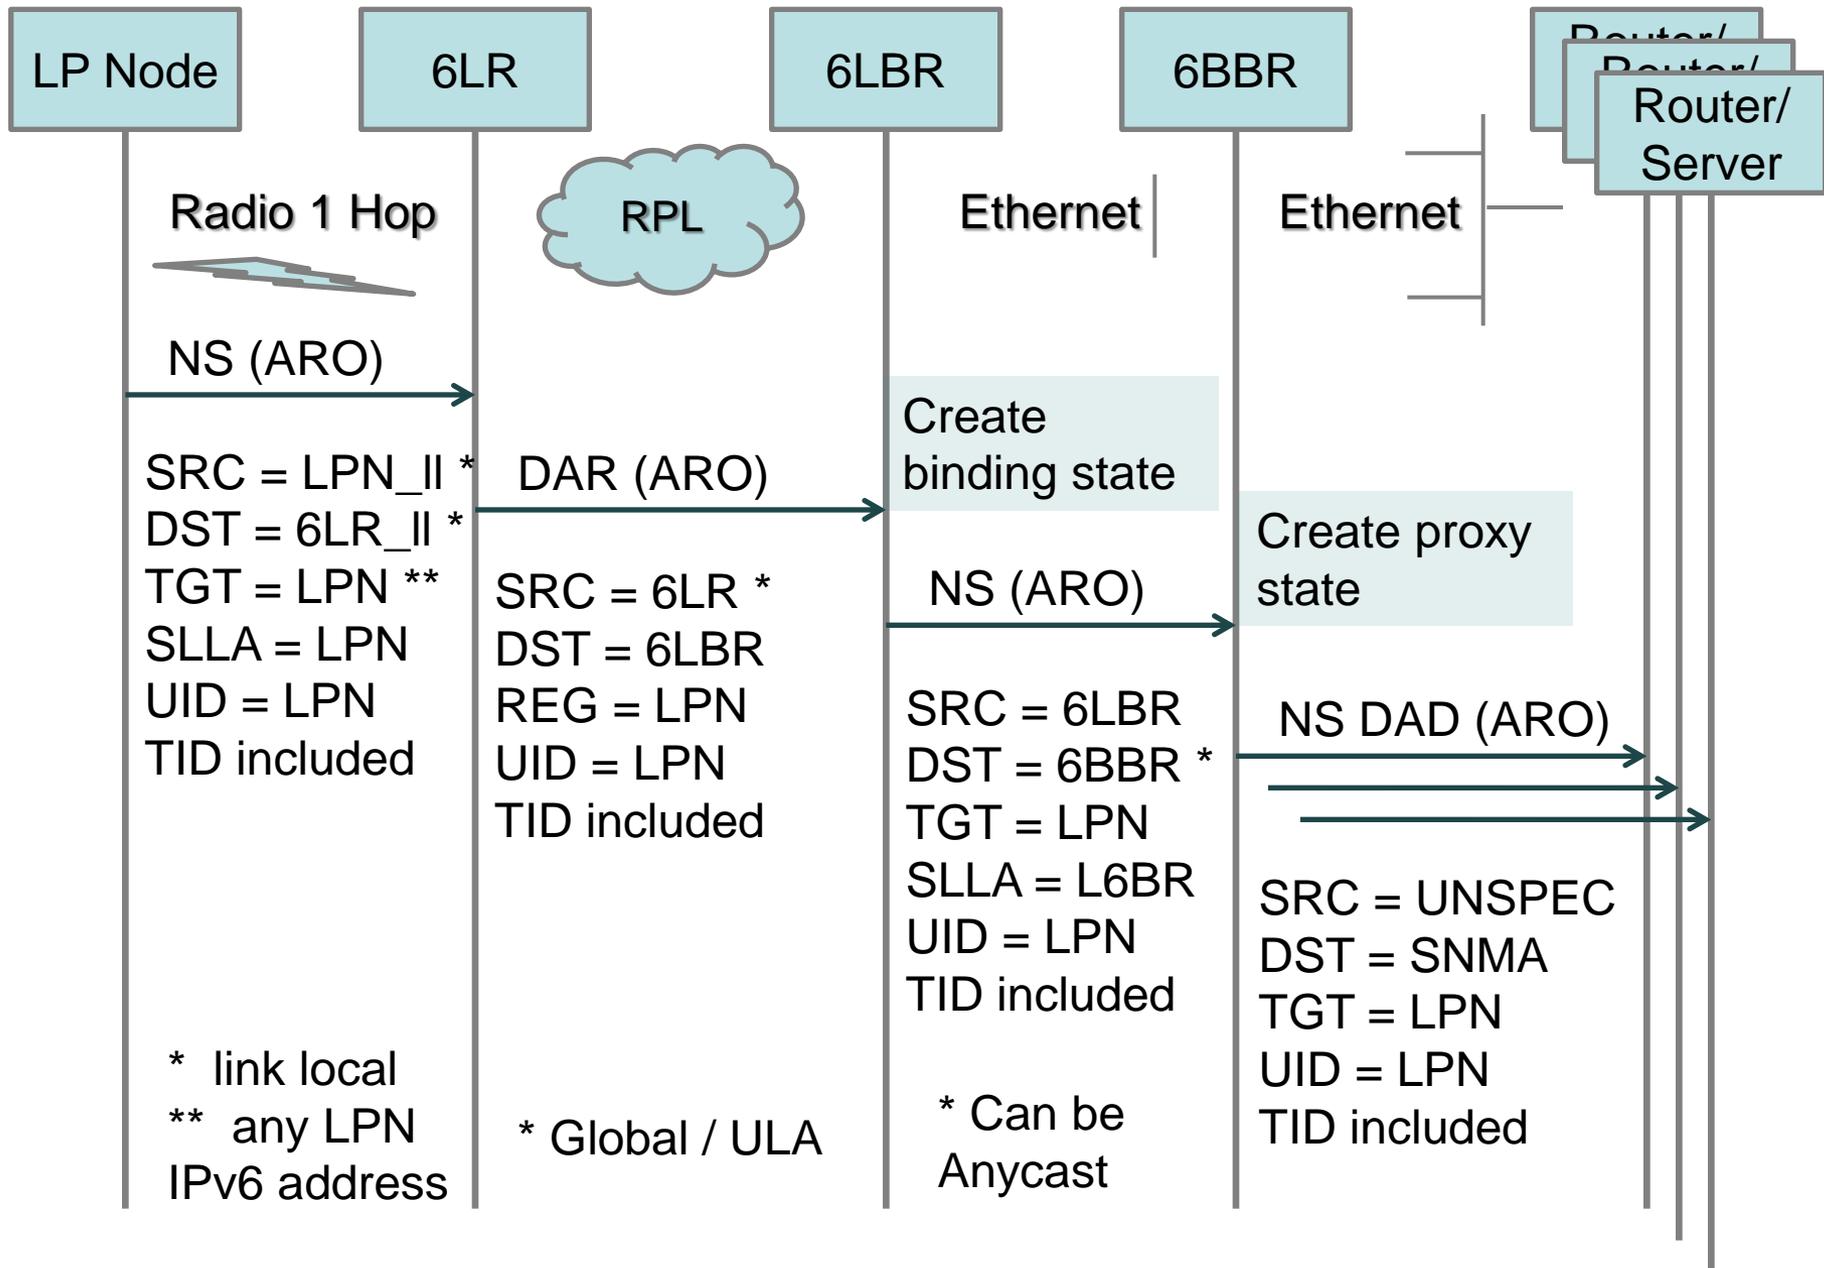

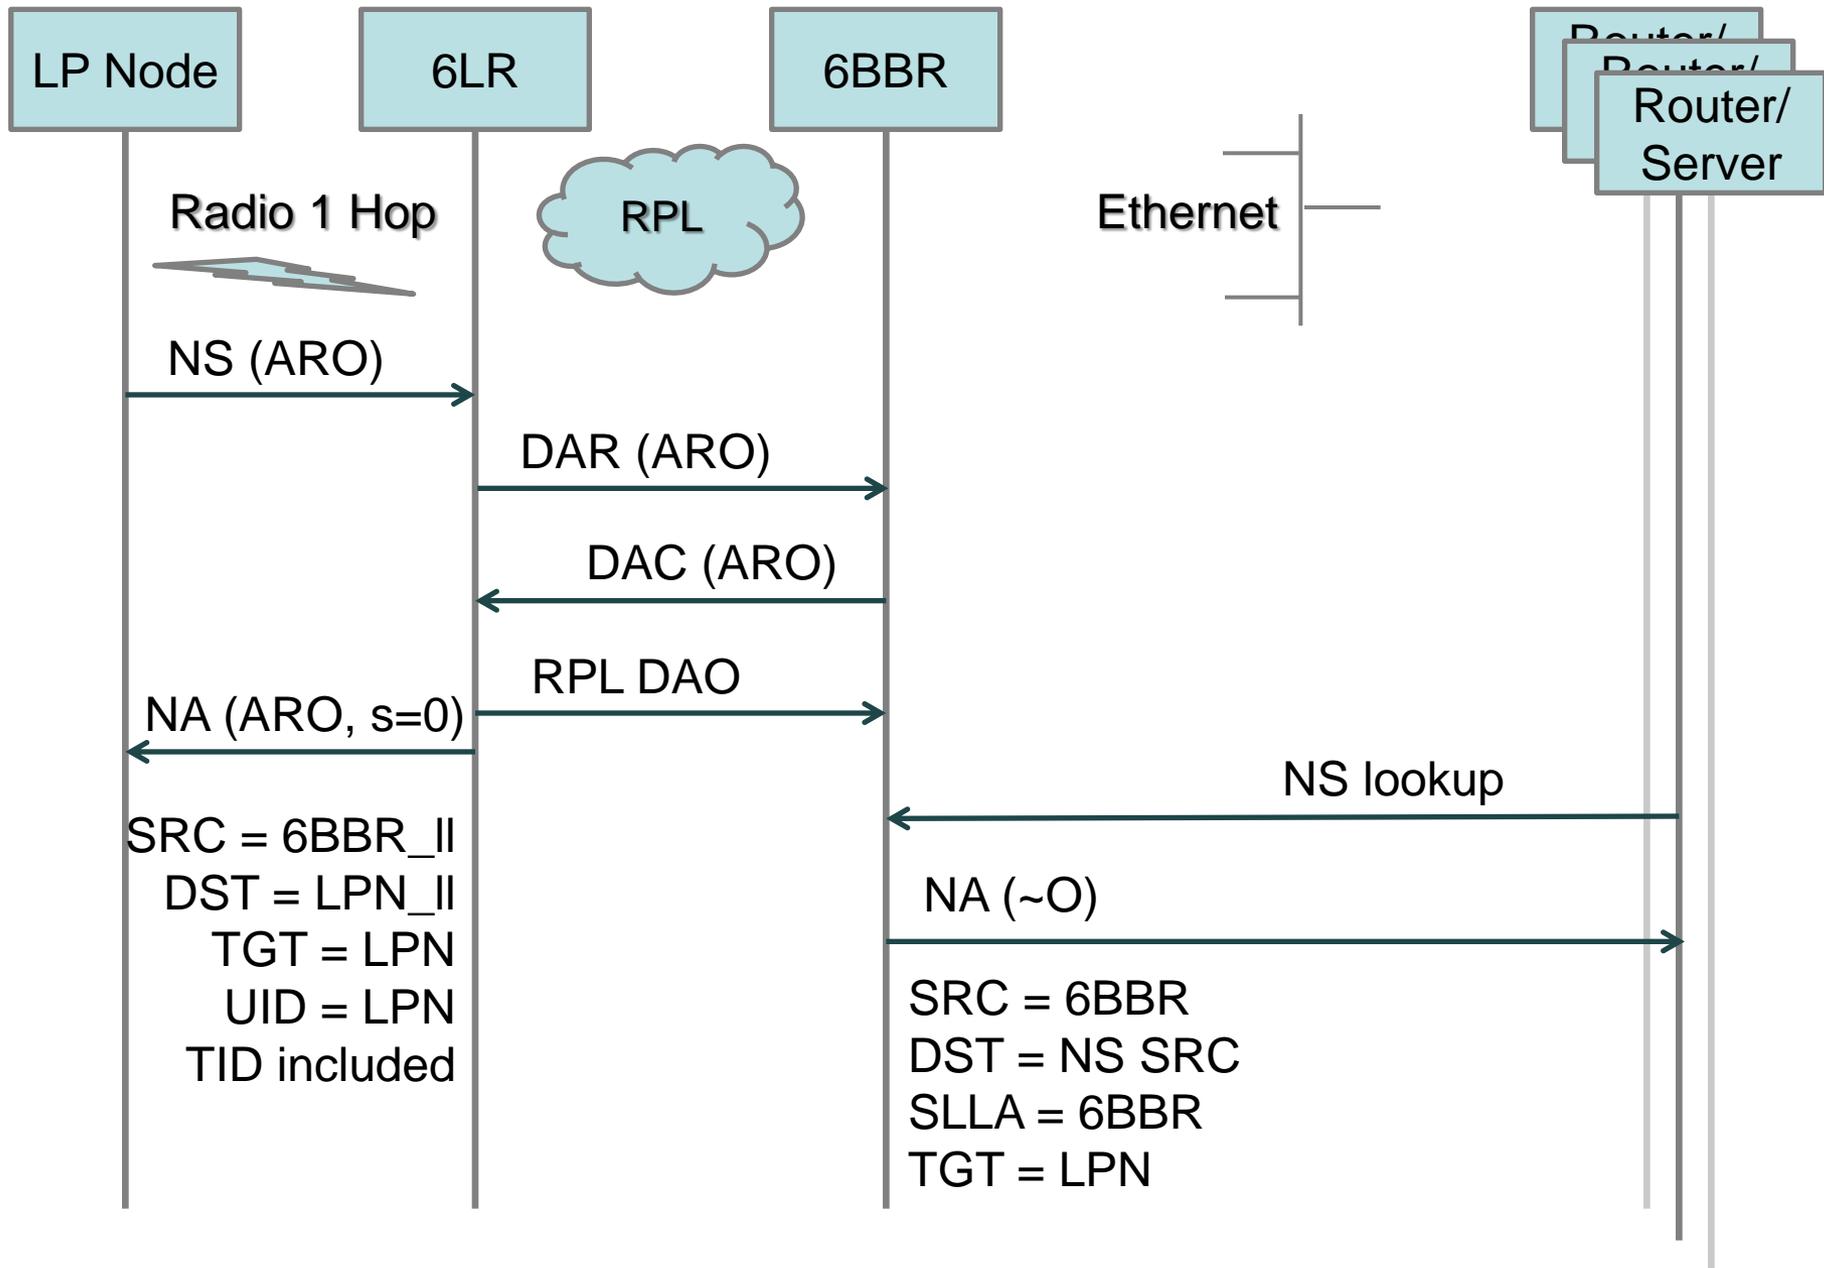

**FLOWS IF 6LBR COLLAPSED
WITH 6BBR**

Thank you!
