

Coordinating multiple autonomic functions

IETF92 – Dallas

Pierre Peloso, Laurent Ciavaglia

Why we need coordination?

Metric value conflict:

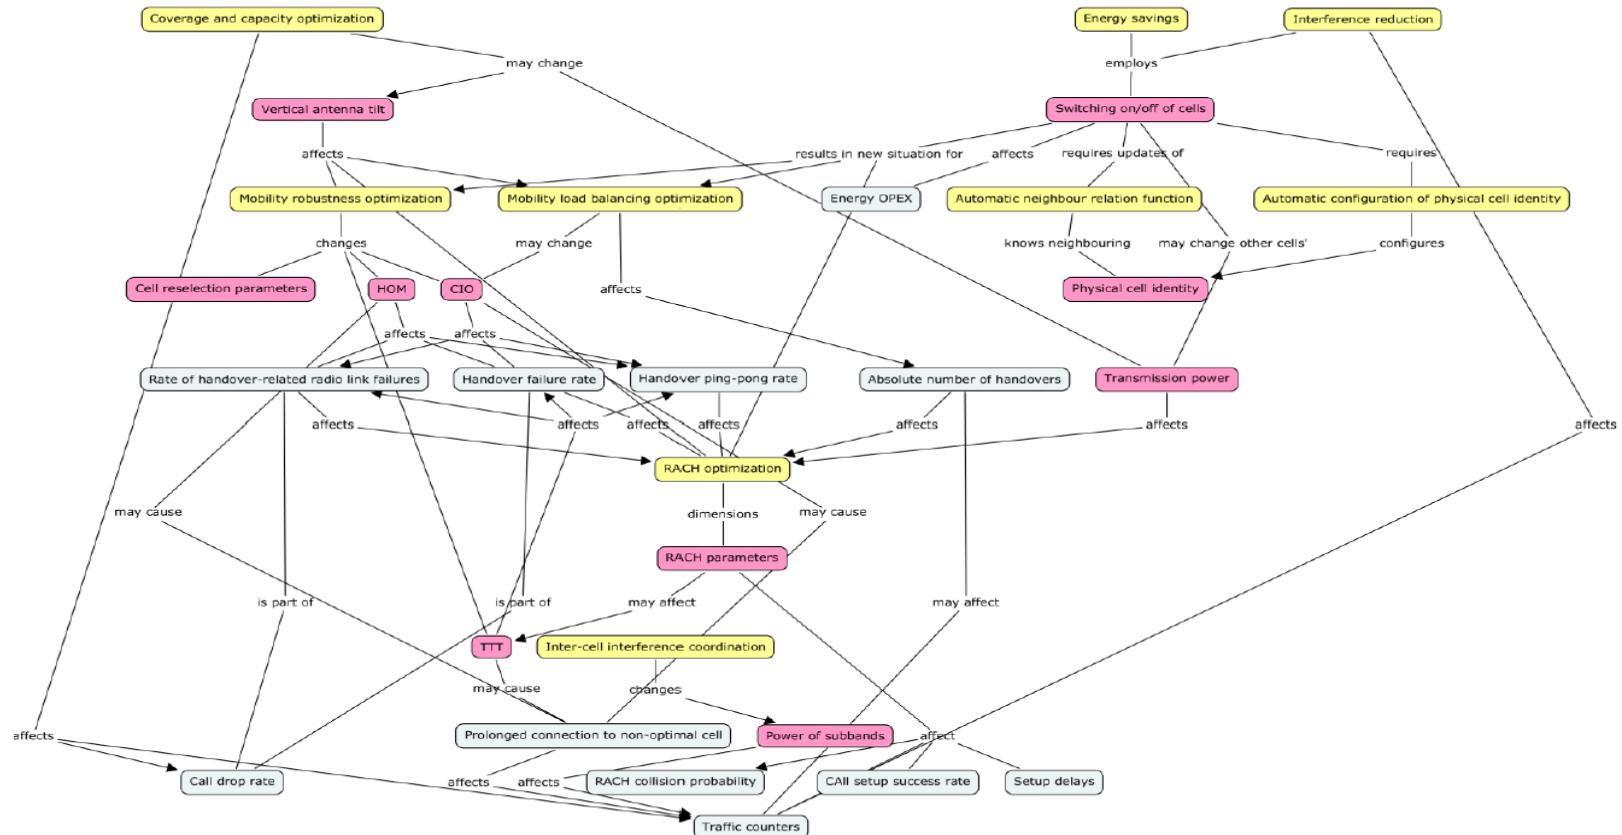

One metric is influenced by parameters of different autonomic functions

Parameter value conflict:

One parameter is modified by different autonomic functions

Why we need coordination?

- a static conflict map...

Interactions types

- Conflict
 - see previous slides
- Cooperation
 - An autonomic function can improve another one
- Dependency
 - An autonomic function cannot work without another one

Coordination lifecycle

Specification	<ul style="list-style-type: none">-Autonomic function descriptor (metrics, parameters, actions...)-Static map, a priori knowledge
Deployment	<ul style="list-style-type: none">-Per instance/resource:<ul style="list-style-type: none">•inventory of metrics monitored, of actions performed and computation paths•build connected control loops graphs•Identify conflicting control loops-Deployed conflict map
Run-time	<ul style="list-style-type: none">-Arbitrate conflict based on coordination strategies and available mechanisms-Infer new dependencies-Dynamically update interaction groups

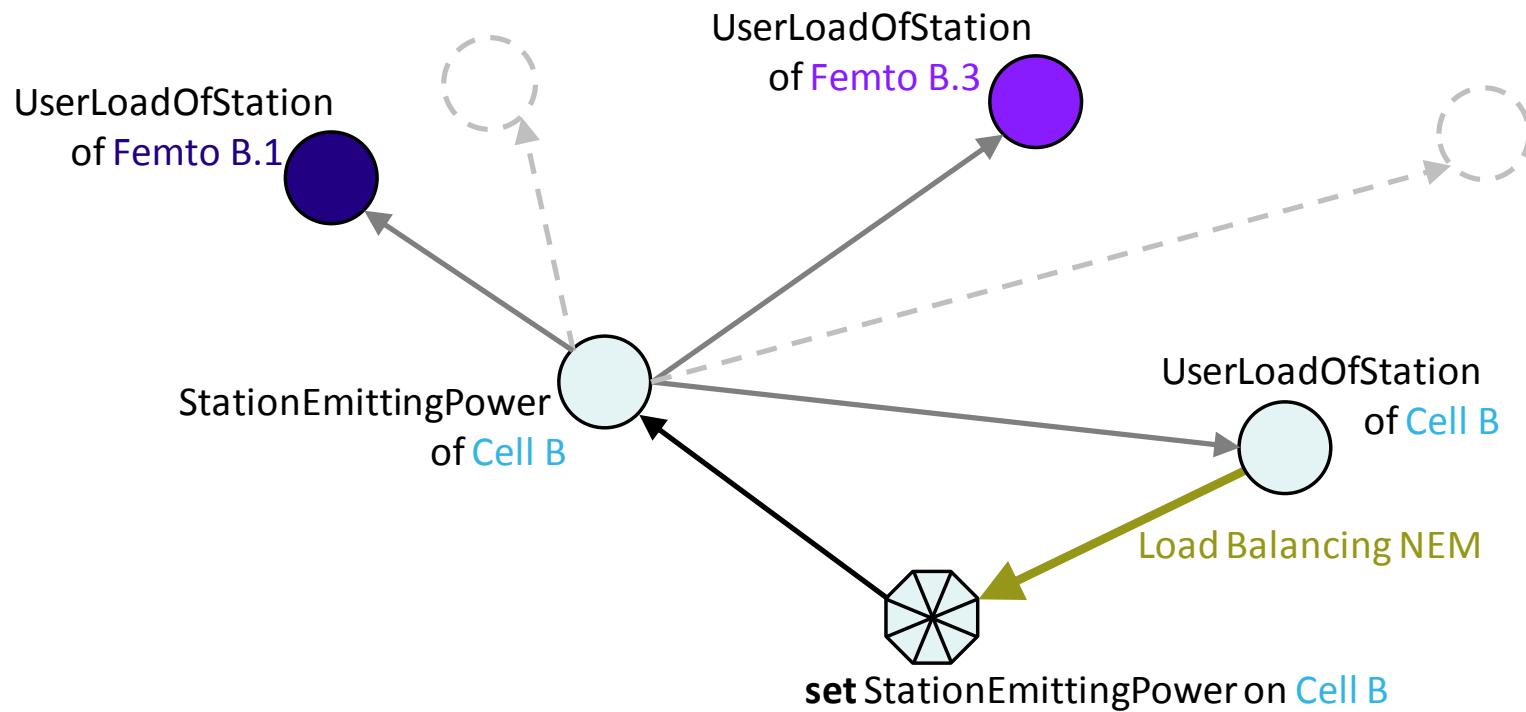

Knowledge-based Conflict Identification

StationEmittingPower_{CellB} = LoadBalancing(UserLoadOfStation_{CellB},...)

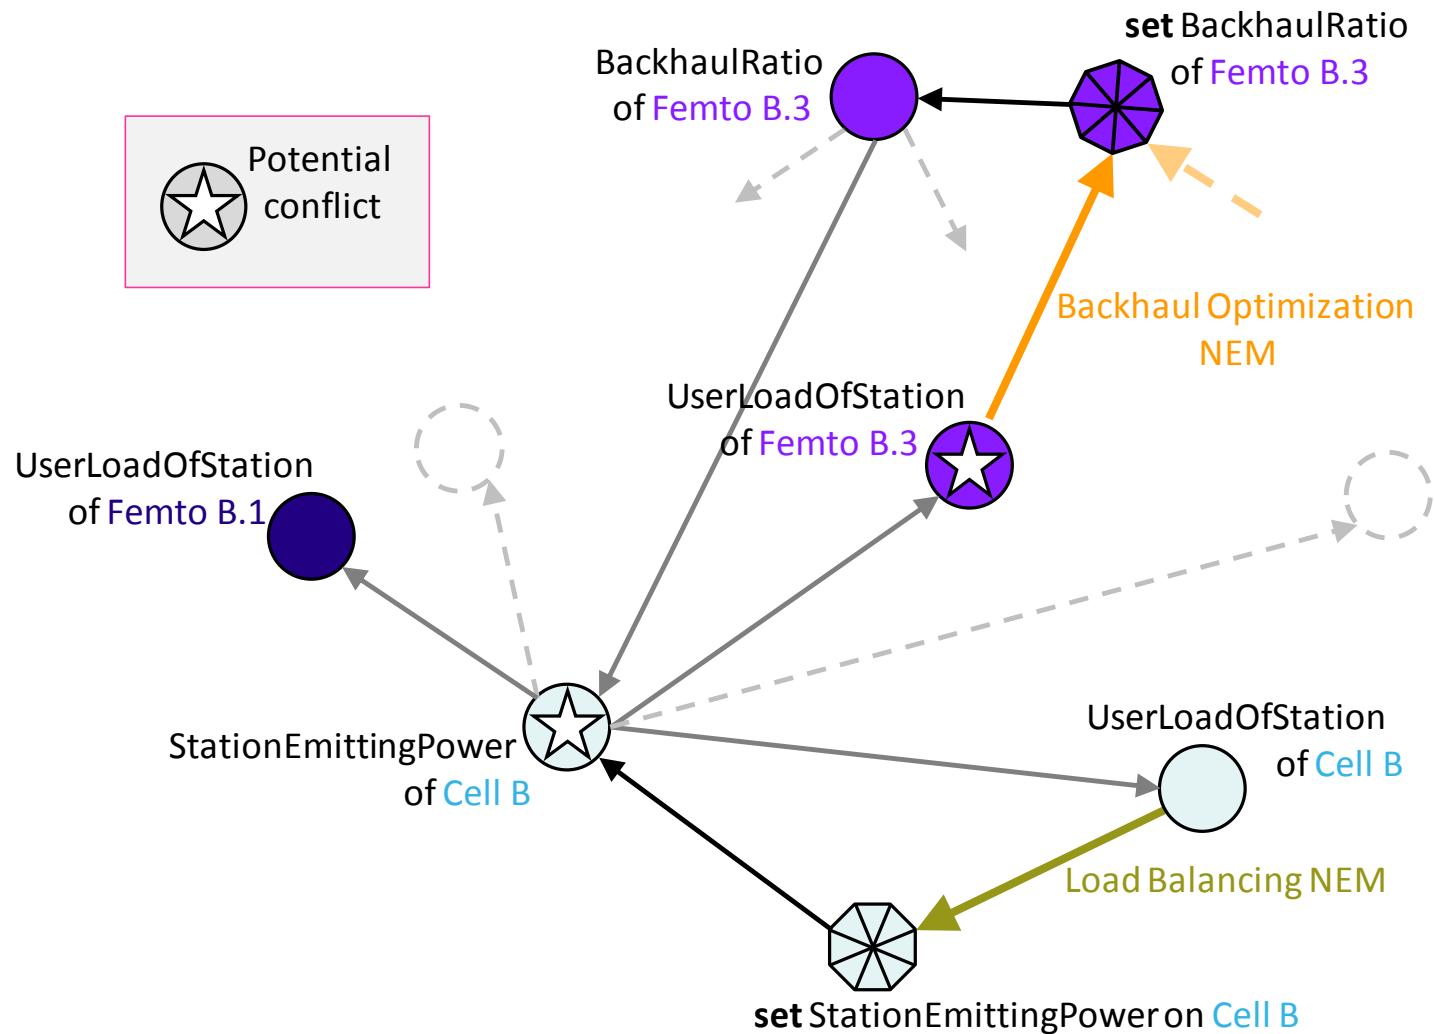

[... in order to perform action] ← [takes as input...]

UserLoadOfStation_{FemtoB.3} = $F($ StationEmittingPower_{CellB}, FemtoB.3.....,.... $)$

← [has impact on...]

Knowledge-based Conflict Identification

Coordination strategies

- Random, token-based...
- Separation in time
- Hierarchical optimization
- Centralized multi-objective optimization
- Other control theory approaches

Discuss: ANIMA implications

- Coordination:
 - a must-have feature (stability, convergence)
 - cross-autonomic functions (re-usable component)
 - requires common descriptors, lifecycle (registration/discovery, negotiation...)
 - common representation of information/knowledge (cf. conflict map)
 - common “control/command” interface
