

draft-ietf-dnsop-root-loopback
IETF 92, Dallas

Warren Kumari
Paul Hoffman

Document history

- Individual draft, turned into WG -00 after IETF 91 in Hawai'i
- Issued -01 in January
 - Clarified intent in the Abstract and Introduction
 - Added lots more warnings about what happens if the implementation fails, and a few ways to prevent that

Status

- Meant to be an Informational RFC
 - The text explicitly says that it is not considered a “best practice”
- Most of the recent discussion is about the document status, not the practice described
- Note about putting the root server “local” but not on the loopback; not much support for this
- Still waiting on a PowerDNS configuration

Next steps

- WG agrees on status
- WG agrees on any more wording changes
- ...
