RFC 6761 & Special Names

Issues

- RFC 6761 has a process for updating the "special use names" registry
  - DNS compatibility
  - Special properties
  - Enable new functionality
  - Single label
  - Refers to IETF MoU with ICANN
- We have multiple requests for special use names in the WG since we rechartered to accept them

What We're Doing

- Virtual Interim meeting to talk about this bundle of drafts and issues in applying 6761
  - Operational impacts? (does this scale?)
  - Documentation of use?
  - Grandfathering?
  - Arbitrary strings?
  - 6761bis?
- Quick review today of a couple of drafts
  - .onion has a timeliness concern
  - draft-chapin waiting patiently
  - .alt attempts a meta-solution
  - trying to develop the conversation for the interim
