Problems with Current Network Protocols

Model Driven Protocol/Platform

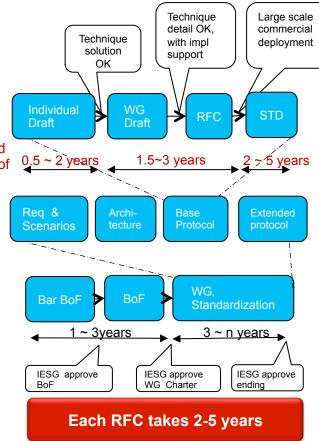

Various Protocols, Long Process to Market

Multi-vendors and multi-operator networks need standardized protocols to cover every aspects of network functions

- ■RIP/ISIS/OSPF/BGP/PIM
- ■LDP/RSVP-TE/PCE
- ■L2VPN/L3VPN/E-VPN
- ■STP/TRILL
- ■BFD/FRR

7000+ RFCs

BGP Protocol History

RFC 1771, A Border Gateway Protocol 4 (BGP-4)
RFC 1772, Application of the Border Gateway Protocol
in the Internet

RFC 1965, Autonomous System Confederations for BGP

RFC 1966, BGP Route Reflection: An Alternative to Full-Mesh IBGP

RFC 1997, BGP Communities Attribute

RFC 2270, Using a Dedicated AS for Sites Homed to a Single Provider

RFC 2283, Multiprotocol Extensions for BGP-4

RFC 2385, Protection of BGP Sessions via the TCP

MD5 Signature Option

RFC 2439, BGP Route Flap Damping

RFC 2842, Capabilities Advertisement with BGP-4

RFC 4271, A Border Gateway Protocol 4 (BGP-4)

RFC 4360. BGP Extended Communities Attribute

RFC 4456, BGP Route Reflection: An Alternative to Full Mesh Internal BGP (IBGP)

RFC 4760, Multiprotocol Extensions for BGP-4

RFC 5492, Capabilities Advertisement with BGP-4

RFC 7196, Making Route Flap Damping Usable

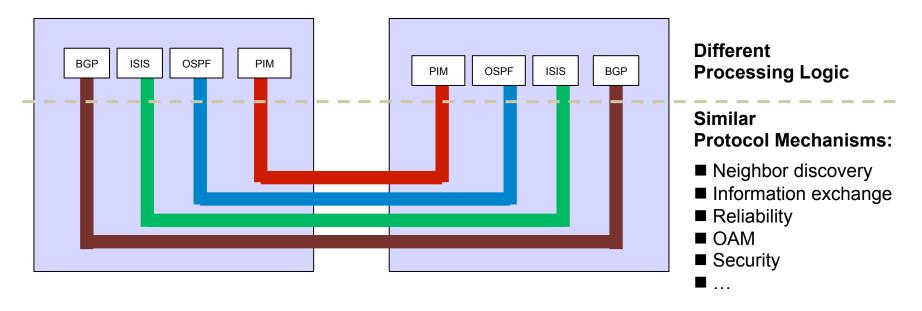

0 0 0

■BGP: 1990~ now, 66 RFCs ■MPLS: 1999~ now, 122 RFCs

Protocol features expansion makes system complex

Funnel-style Protocols, Duplicated Functions

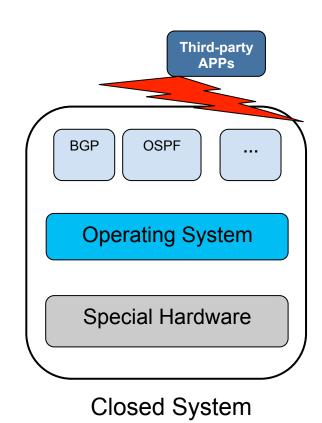

Current network protocols follow a funnel-style architecture: every protocol has a relatively complete and independent architecture, has its own mechanisms of everything

- Pros: protocols are decoupled, can operate and evolve independently
- Cons: every protocol has a set of similar but different mechanisms, introduces a lot of duplication and complexity to the device/system

Closed Architecture, Hard for Innovation

- Current routers are closed box, both hardware and software are provided by router vendors, the period of system version update is long
- Existing interfaces (CLI/SNMP/Netconf)
 only provide limited openness, and lots of
 differences between different vendors &
 versions, hard to develop applications
 based on these interfaces
- Usually do not support integration with third-party applications, cannot support customization or secondary innovation

Think in Another Way

- Can we have a "base/generic" protocol/platform with the following characteristics?
 - Open platform, support:
 - Integration with third-party applications
 - Customization
 - Secondary innovation
 - ...
 - Easy for introducing new protocols and functions
 - No funnel-style duplications
 - ...
 - Incremental deployment
 - No need to update the whole system image
 - Add new service online, without device/system restarting

— ...

GEARS

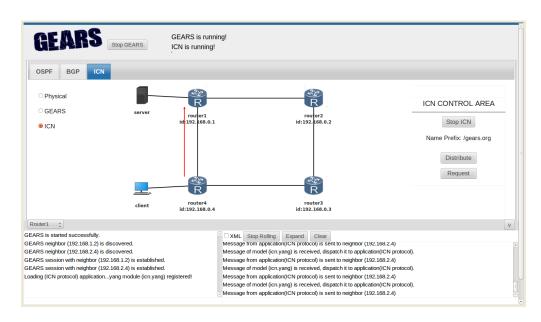

Signalinge(GFARS) eneric protocol/platform

• Annio died oprior text y premeries text (Thursday, avening's Bits-n-Bytes) - But propries to a societa (Thursday, avening's Bits-n-

Byths)nflttippotfotype exists (Thursday evening's Bits-n-

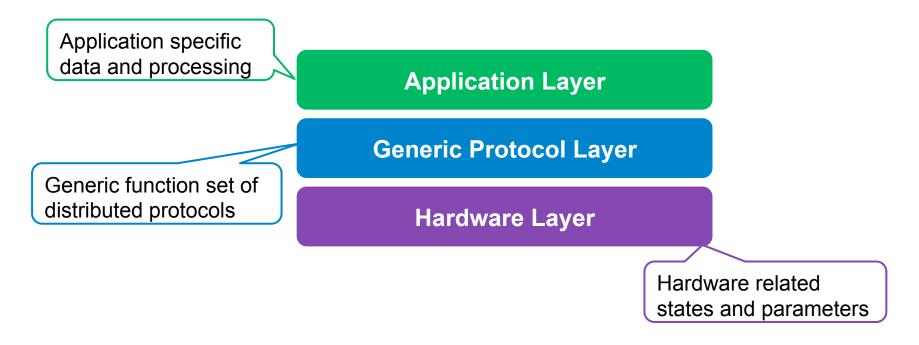

Byossy), supports:

- BISPF
- **BOS**P
- ICN

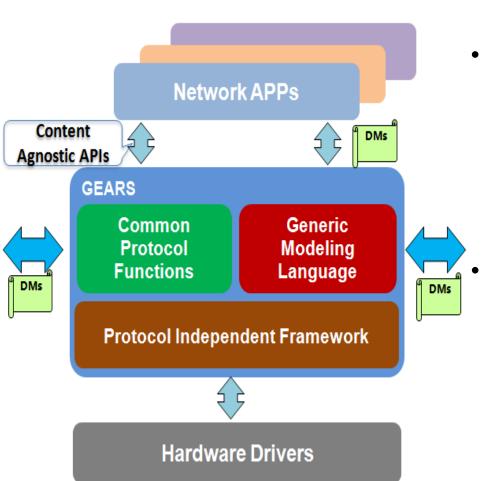

Principle of GEARS

- Layered architecture
 - Re-organize the functions of routing system and protocols

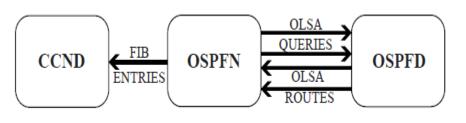

Network innovation similar to develop & install APPs on mobile phone

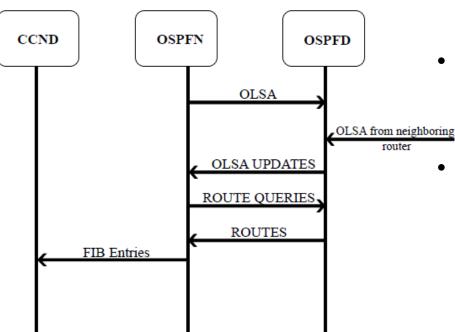

Overview of GEARS

- Open protocol/platform
 - Abstract and implement common protocol functions
 - Provide content agnostic APIs to Apps
 - Provide common single transport channel for all Apps
 - Model driven protocol/platform
 - Data model based protocol data exchange
 - Introduce new protocol by defining new models
 - Standardize data models for interoperability

OSPFN Overview

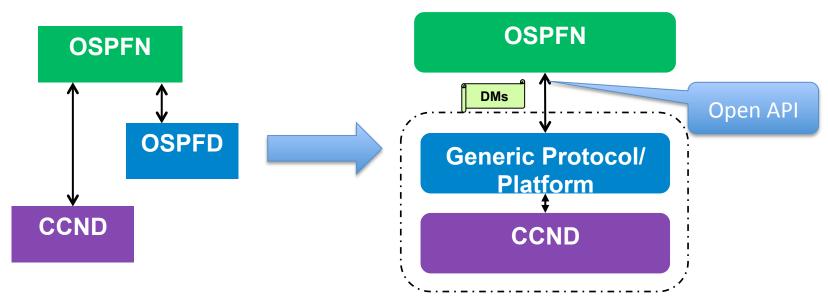

- Leverage the OSPF Opaque LSA (OLSA) for name prefix distribution
- Name prefix distribution:
 - OSPFN generates OLSAs and injects them to OSPFD, OSPFD floods them within the specified routing domain
 - Name prefix reception:
 - OSPFD (a parallel running process) receives the OLSAs and delivers them to OSPFN.

Route query:

- OSPFN will query the route based on Router ID from OSPFD
- Route calculation based OSPF, normally shortest path provided, not perfect to support multi-path

Cited from the OSPFN paper

GEARS for OSPFN

- OSPFD is replaced by the Generic Protocol Platform (GEARS)
- The interface between OSPFN and GEARS is replaced by the GEARS open APIs
- The OSPFN name prefixes and messages are modeled by YANG
- OSPFN or GEARS can be enhanced to support multi-path function without the limitation of OSPF
 - OSPFN enhancement is equivalence to introduce a new protocol, or
 - Add the multi-path algorithm as a Common Protocol Function to GEARS

Example of OSPFN-OLSA Yang Module

```
module: ospfn
   +--rw ospfn-olsa
      +--rw lsa-age?
                                    uint16
      +--rw options?
                                    bits
      +--rw ls-type?
                                    enumeration
      +--rw opaque-type?
                                    enumeration
      +--rw opaque-id?
                                    uint32
      +--rw router-id?
                                    yang:dotted-guad
      +--rw lsa-sequence-number?
                                    uint32
      +--rw lsa-checksum?
                                    uint16
                                    uint16
      +--rw lsa-length?
      +--rw size?
                                    uint32
      +--rw prefix-format?
                                    enumeration
      +--rw name-prefix?
                                    string
```

Summary

- Simplify protocol design and implementation
- Make innovation easier and faster
- Shorten the standard process and time to market

Next step

- Plan to open it if there are interests
- Contributions and collaborations are always welcome!
