Andrew Sullivan <ajs@anvilwalrusden.com>

Two-way control

- sub.example.com and example.com are in the same policy realm; therefore
 - sub.example.com “accepts” example.com and example.com “accepts” sub.example.com
- What SOPA intended to solve
- No obvious intrinsic link to DNS hierarchy
 - Maybe we want that anyway

One-way control

- example.com has a policy that *ought to* (FSVO) apply to sub.example.com
 - no matter what sub.example.com thinks
 - necessarily linked to the DNS hierarchy
 - need to find “nearest public” boundary
 - does this automatically lead to tree climbing?
