

# **draft-jjmb-Imap-reference- implementation-guide-00**

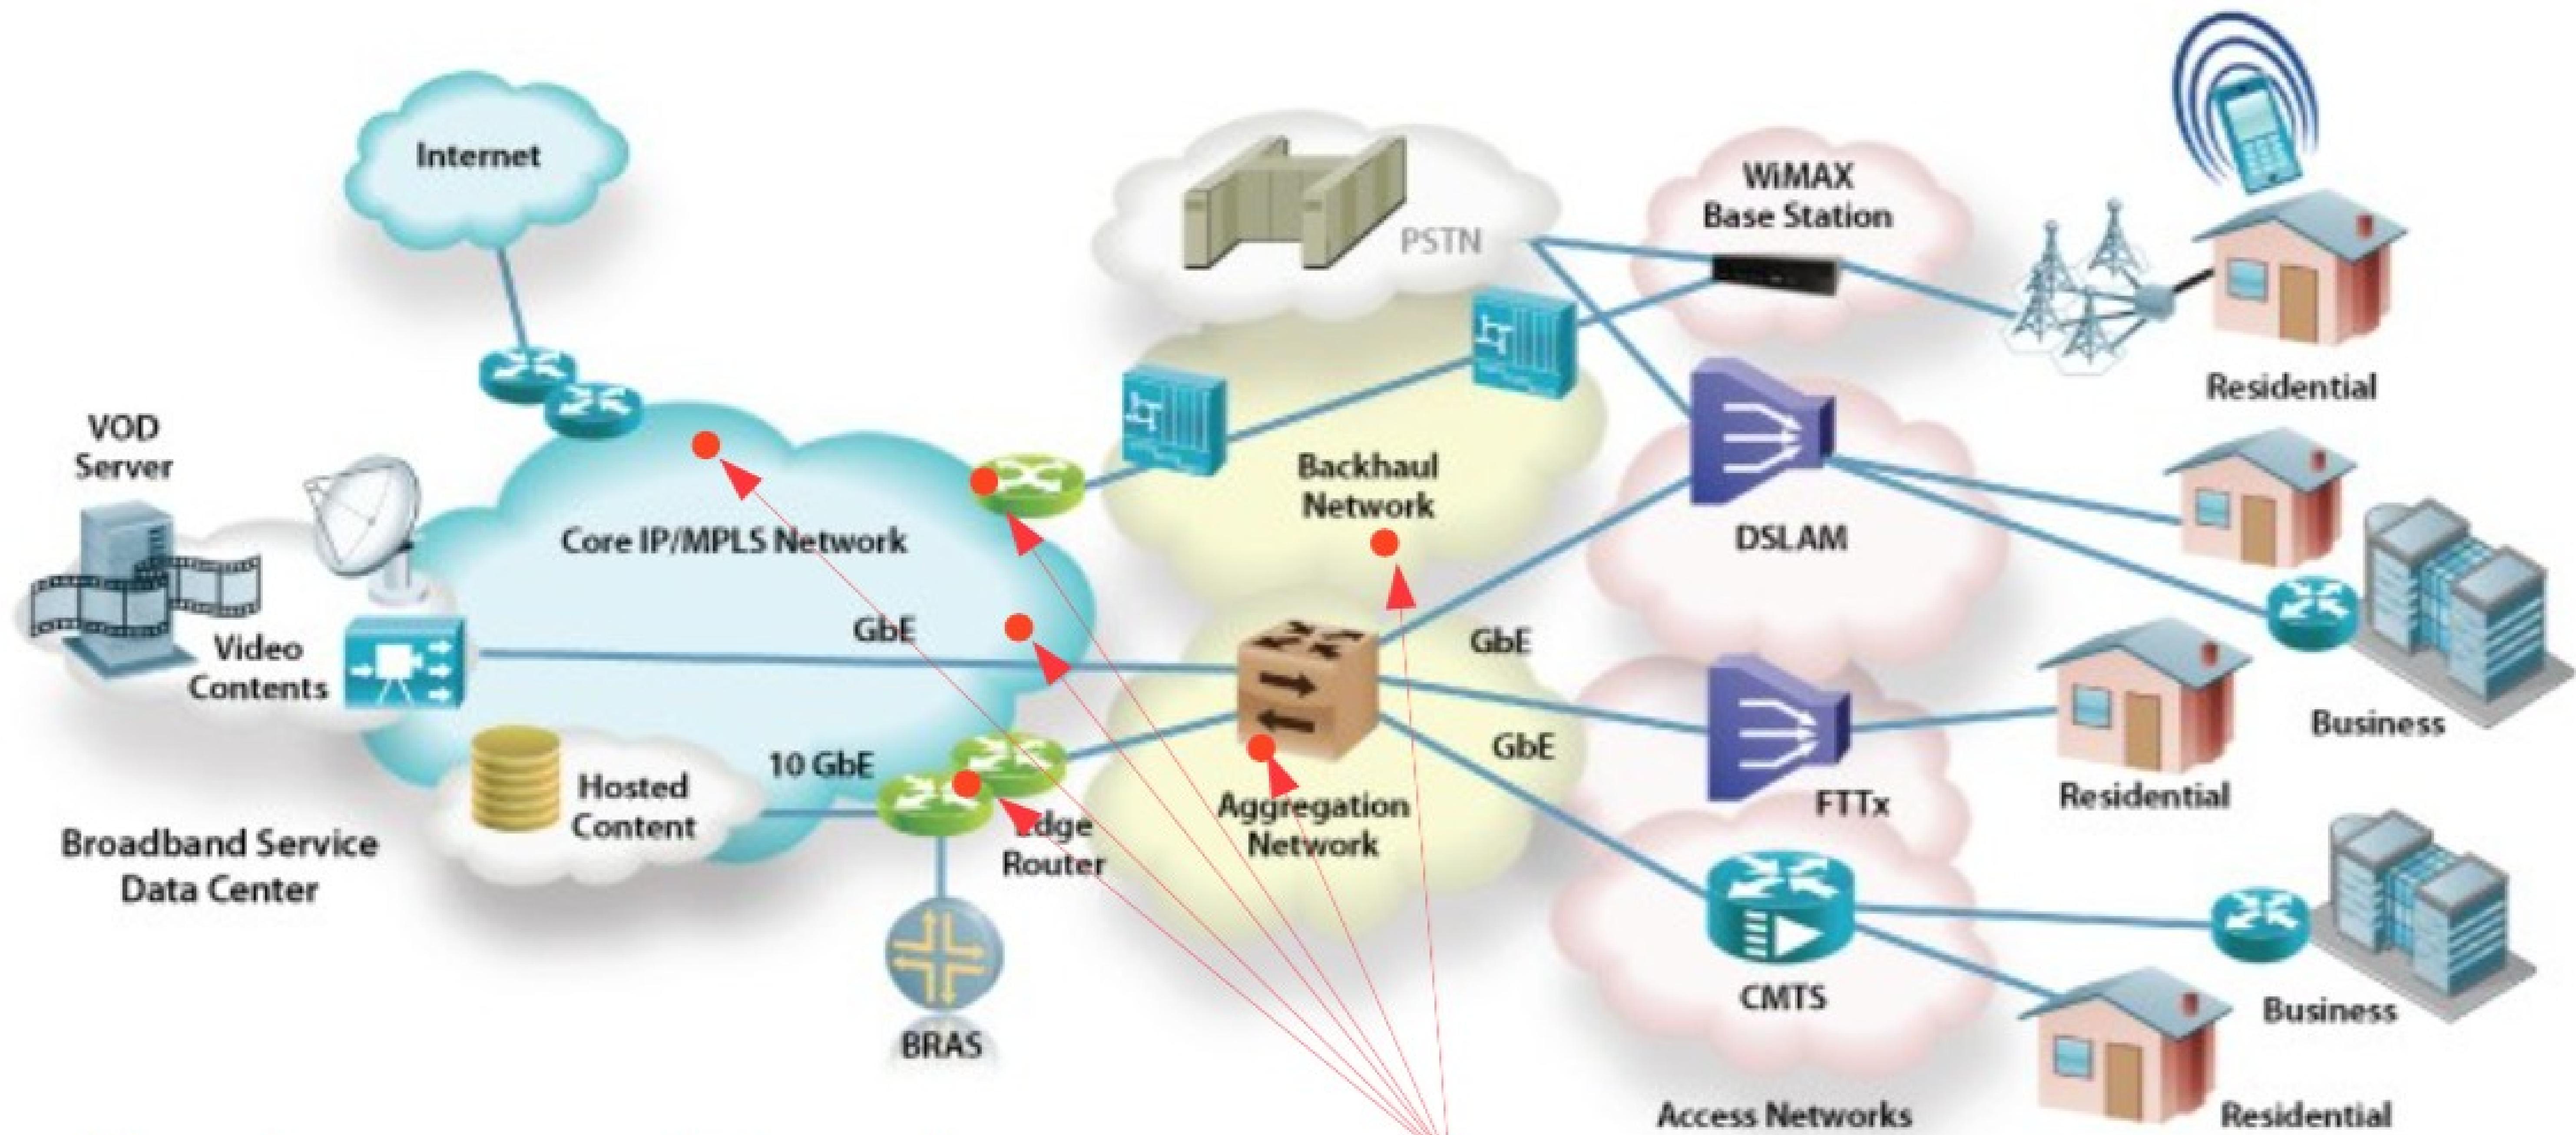

John Jason Brzozowski

Sarvesh Kulkarni

# Background

- Based on Comcast/Villanova University joint R&D that began circa 2012
- Initially developed to measure the deployment of IPv6
- Developed an extensible and scalable system to support large scale measurements
  - Developed before LMAP was formed, mainly because there was a need

# Architecture

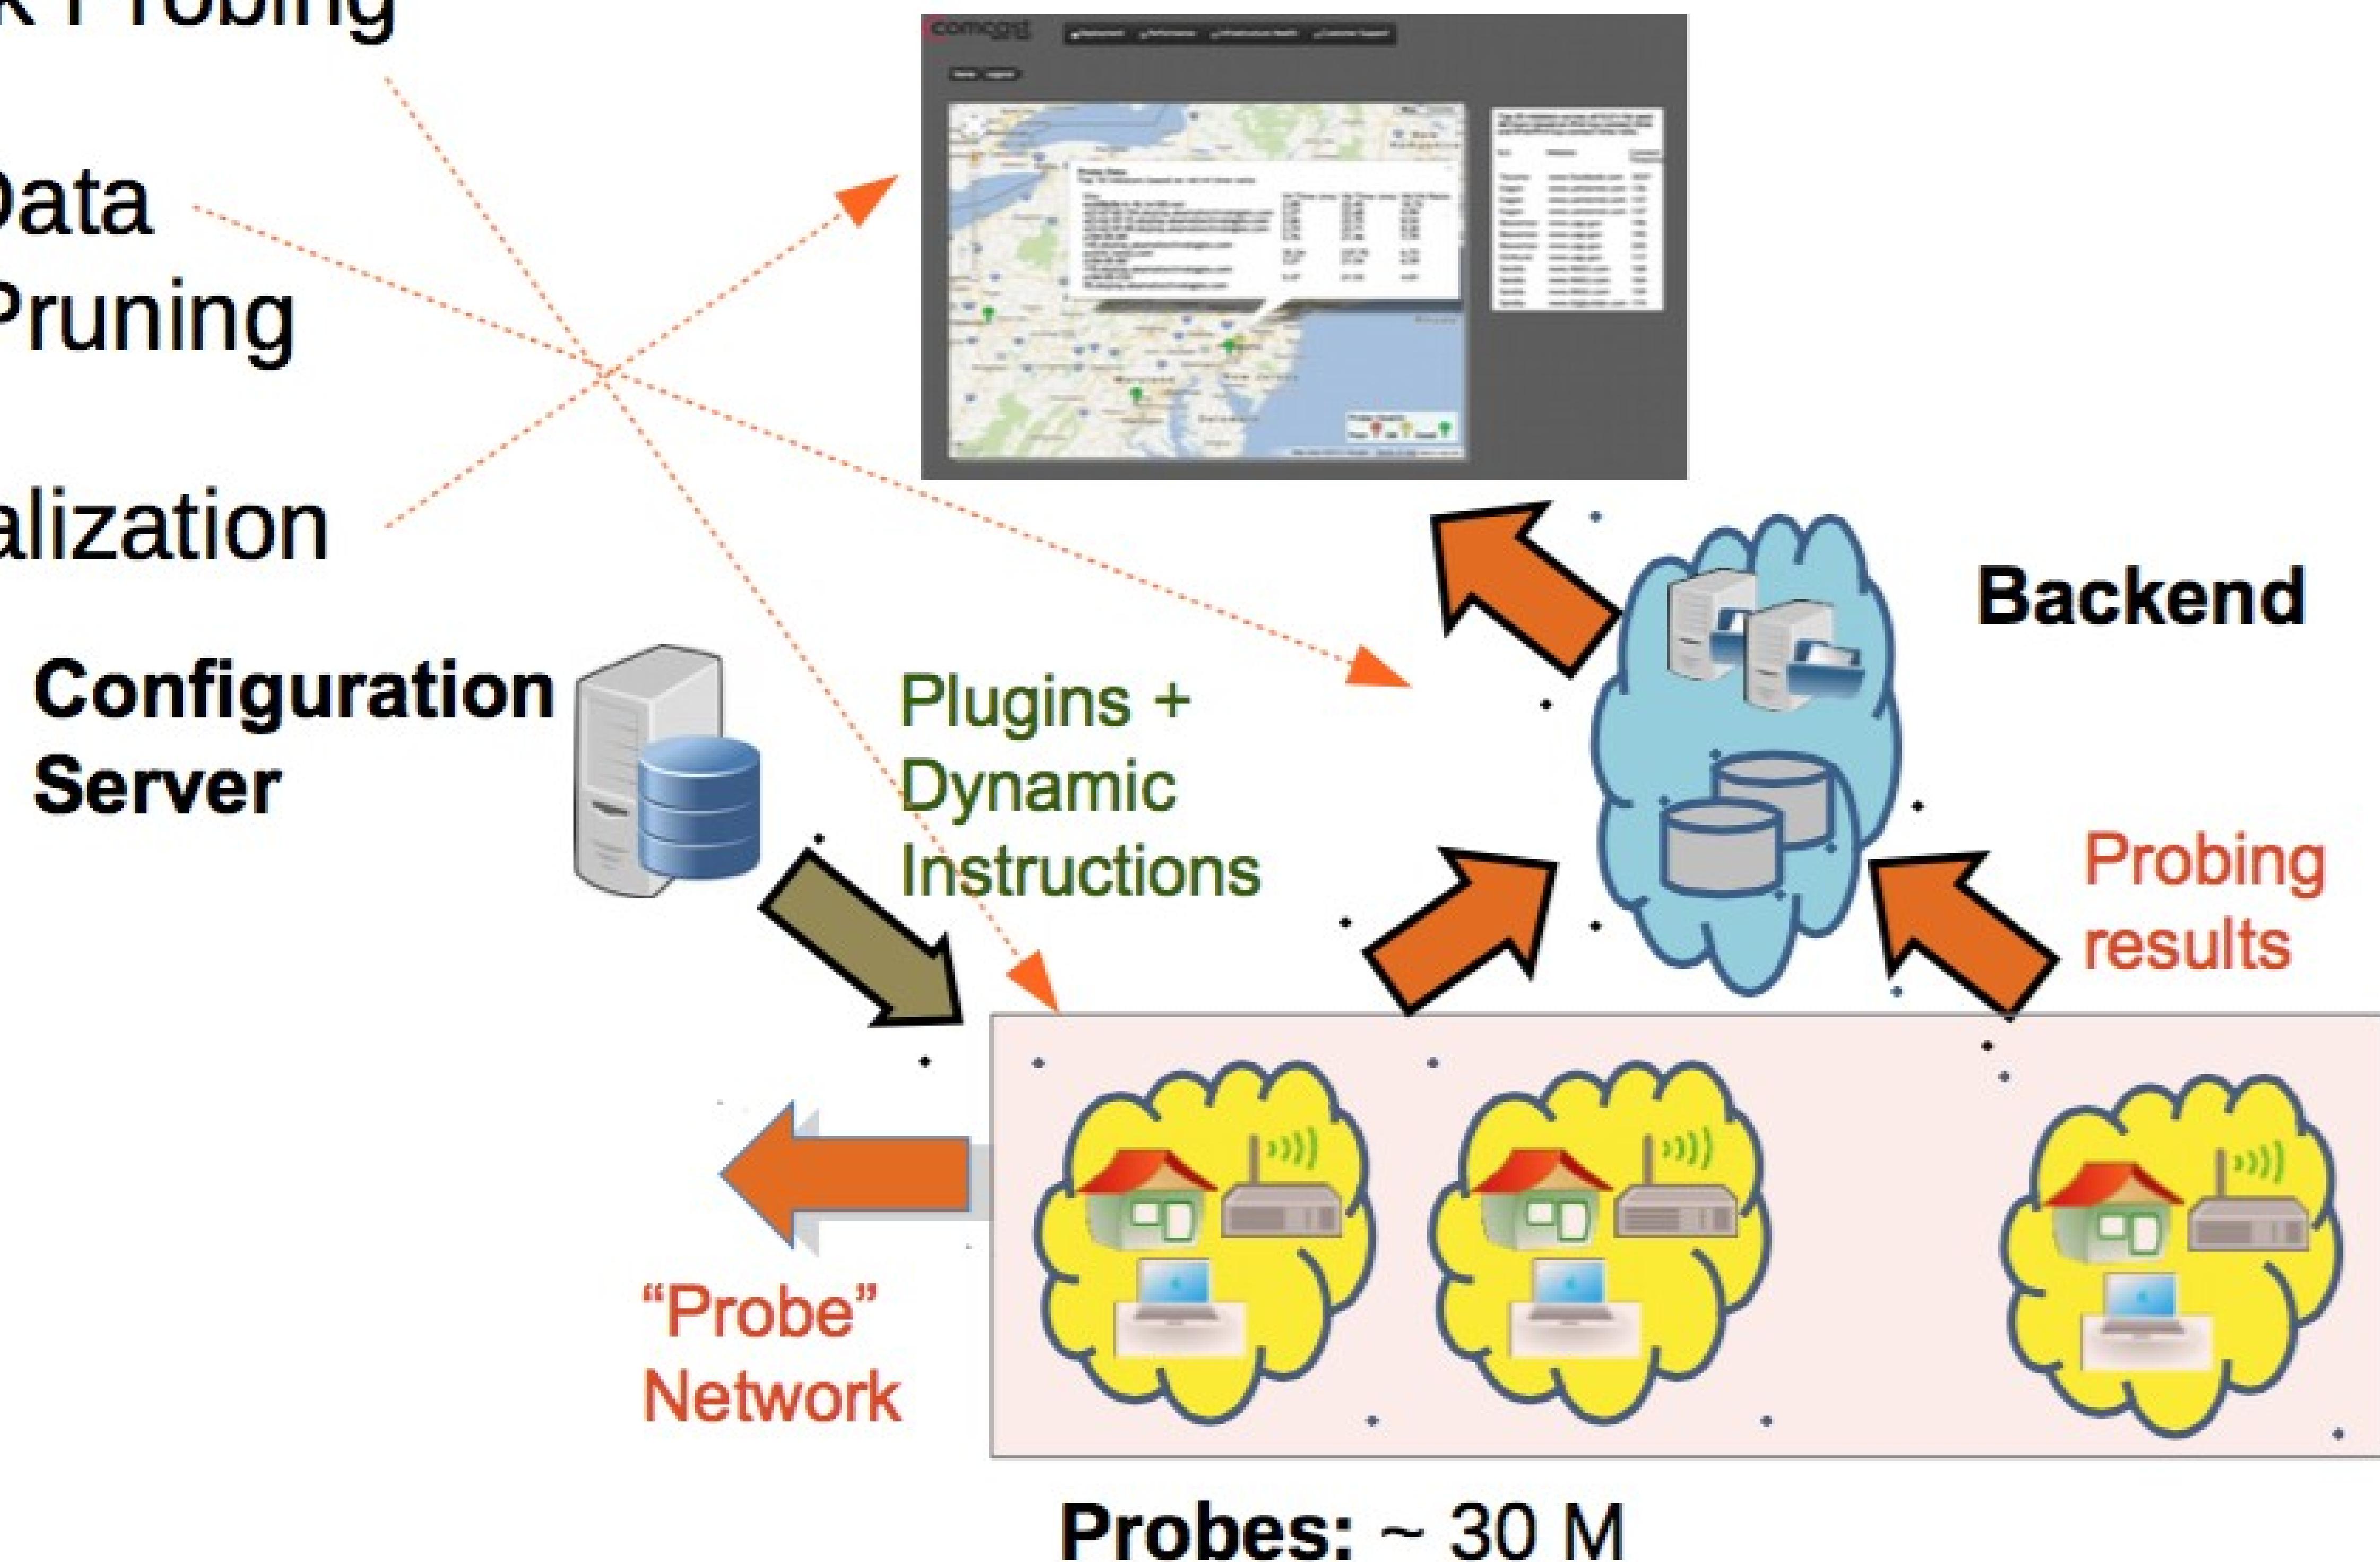

How to assess end-to-end  
network performance?

Perf data  
collection points

# Our Network Monitoring Architecture

- Active Network Probing
- QoS Metrics Data Collection & Pruning
- Effective Visualization

# QoS Metrics Collected by Probe

▪Distribute tests among probes, test top ~2000 servers across the world

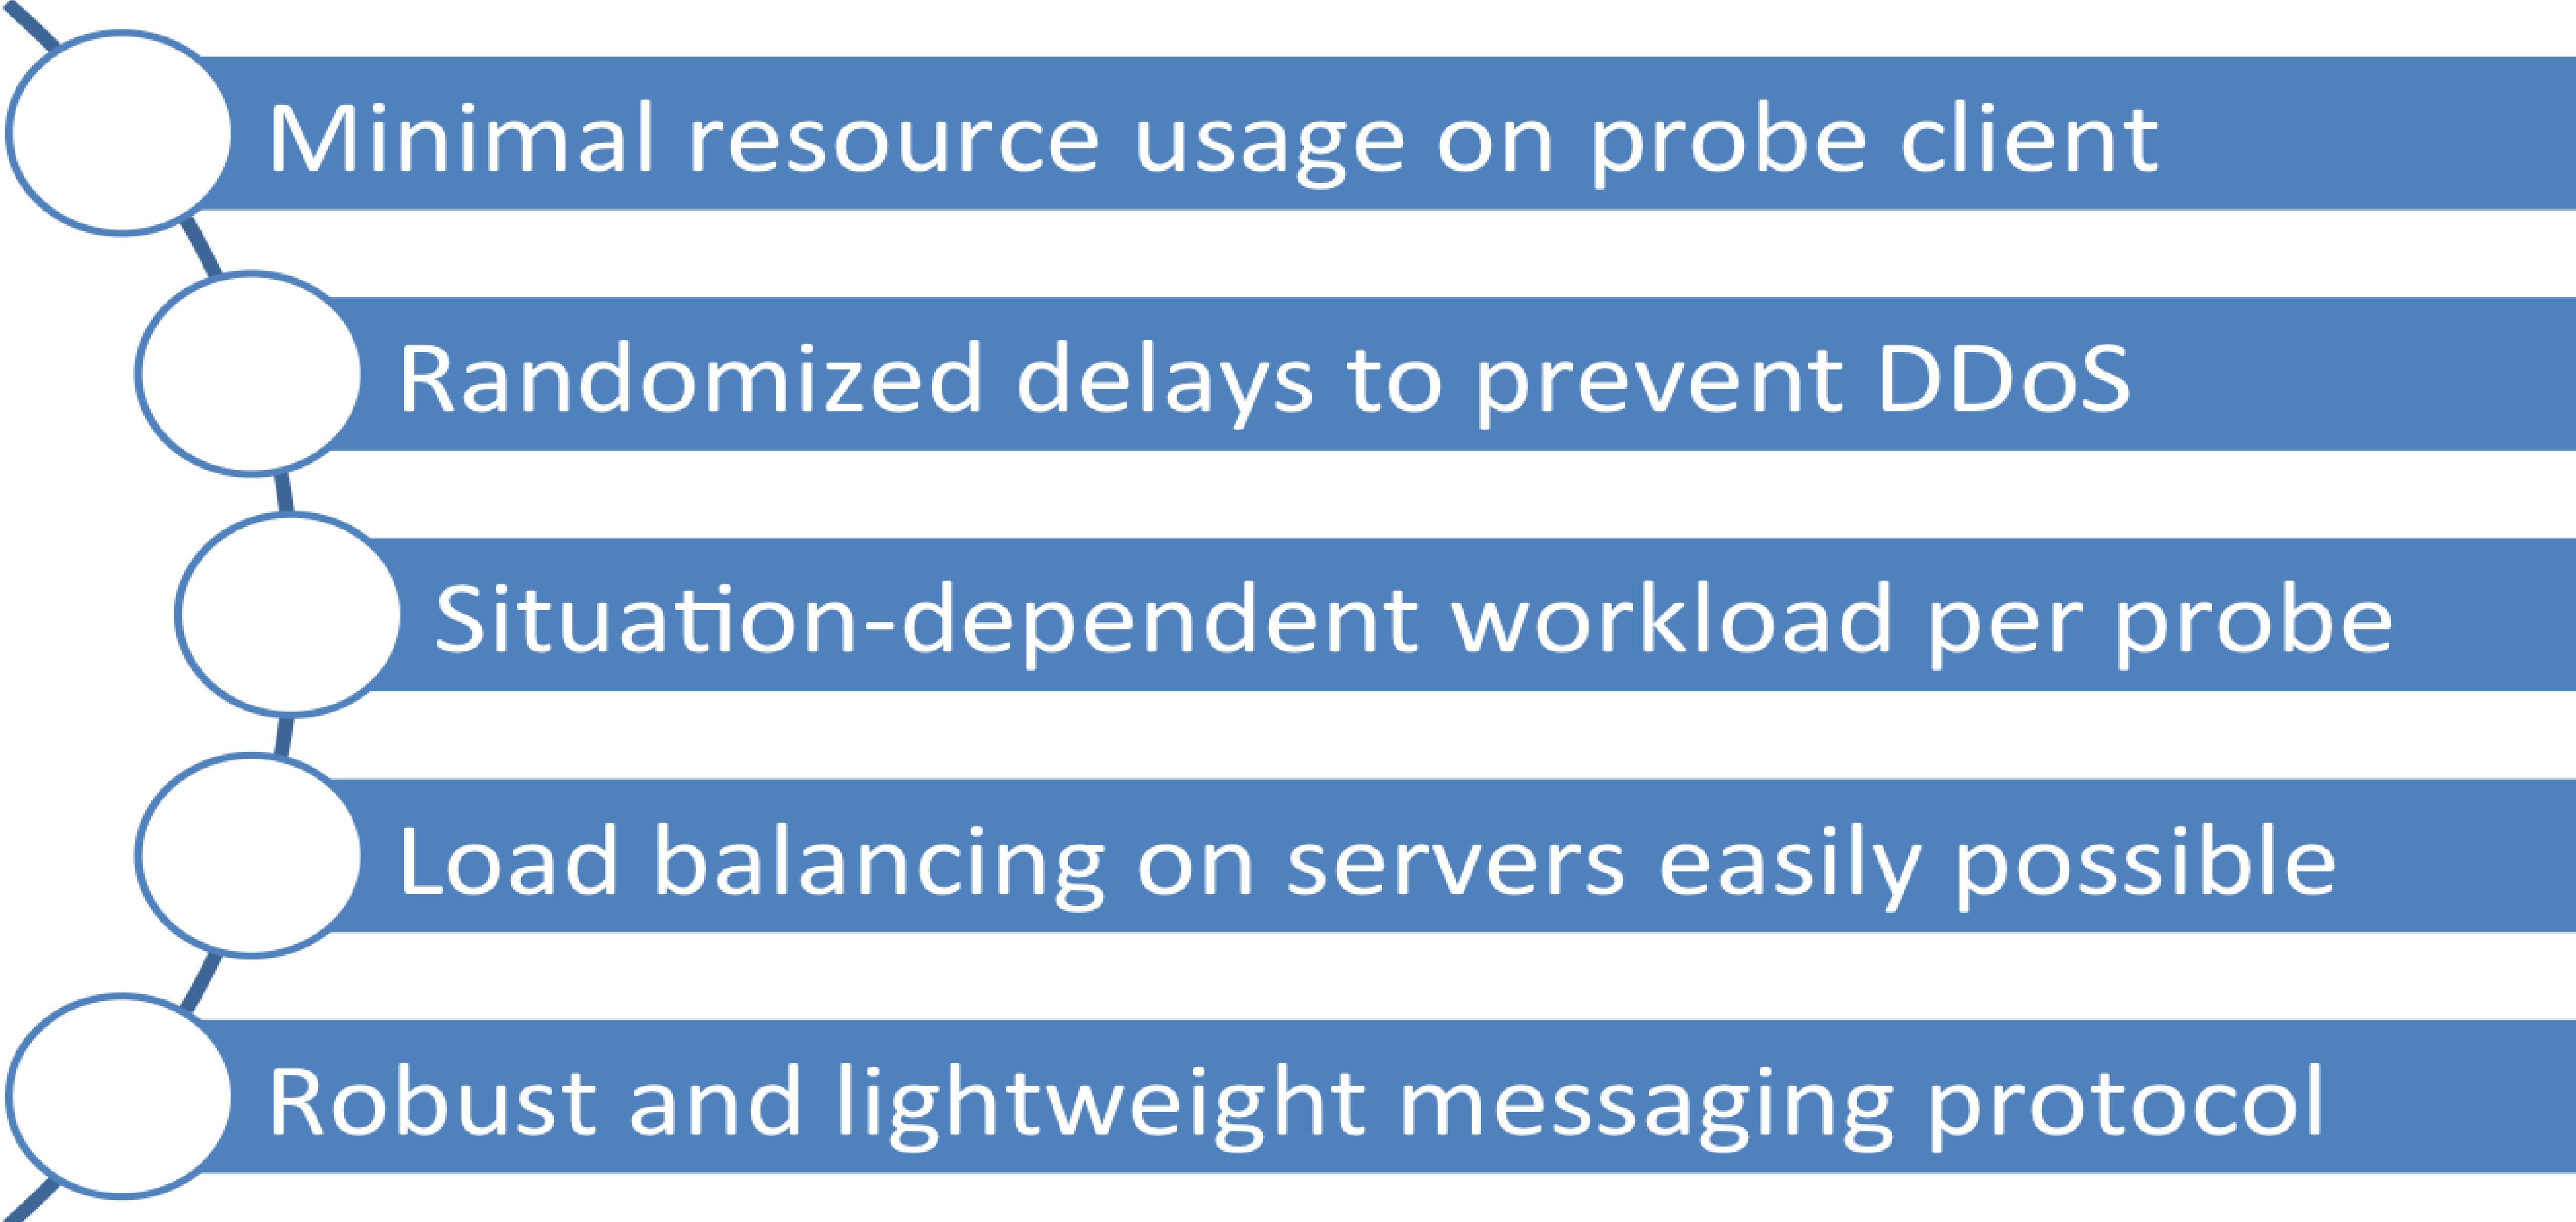

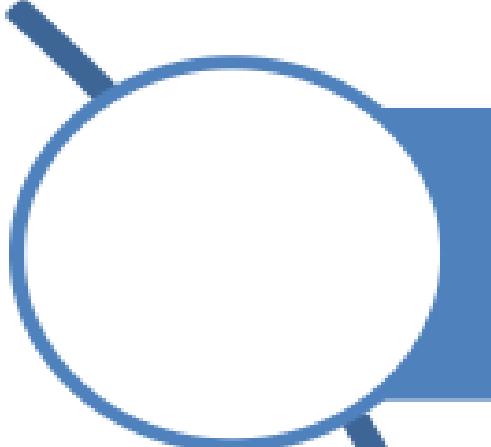

# How Our Work Relates to IETF IPPM & LMAP WG's Standardization Efforts

IPPM = IP Performance Metrics

LMAP = Large-Scale Measurement of Broadband Performance

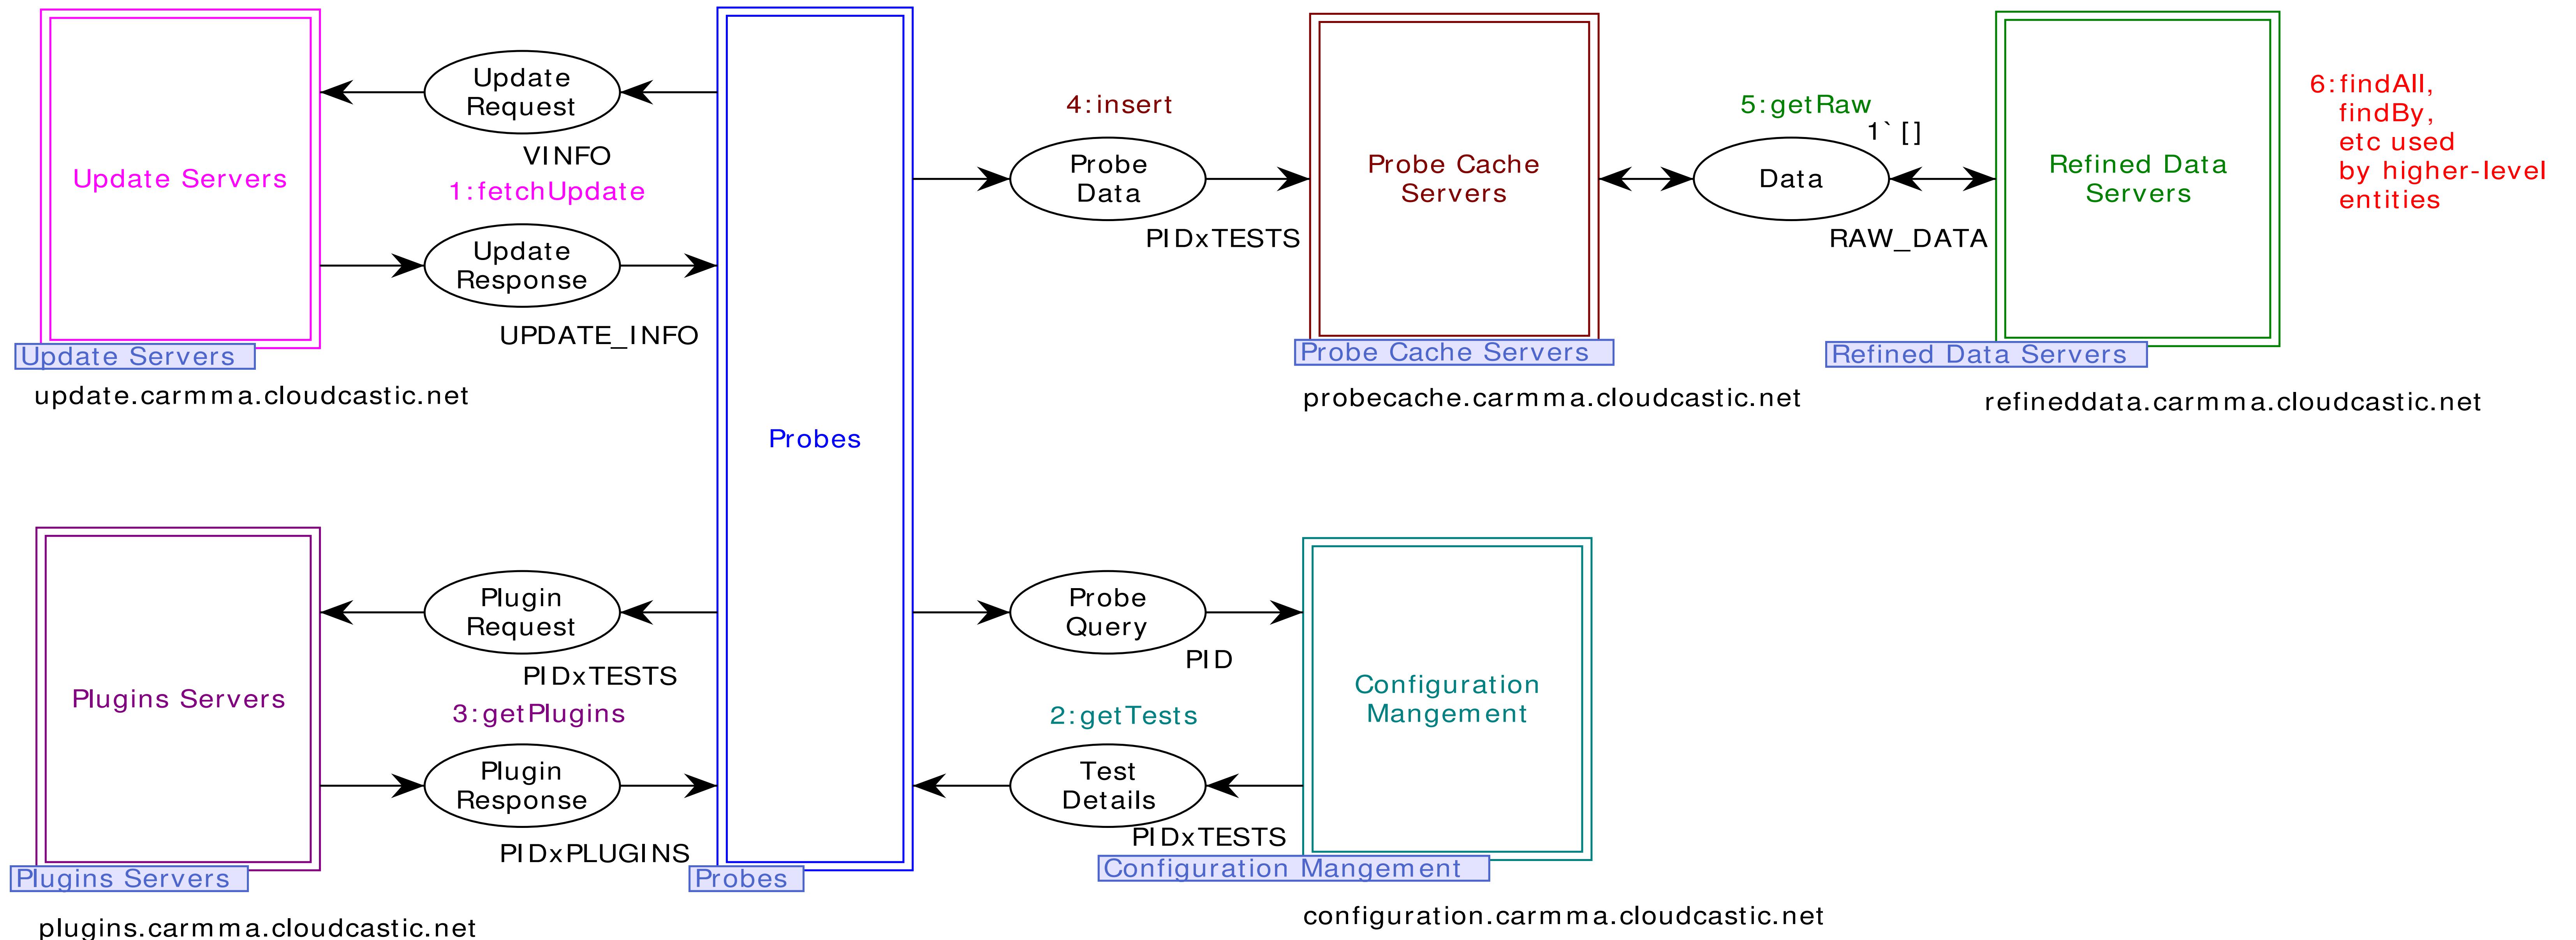

# Probe Design

- 
-  Minimal resource usage on probe client
  -  Randomized delays to prevent DDoS
  -  Situation-dependent workload per probe
  -  Load balancing on servers easily possible
  -  Robust and lightweight messaging protocol

# Back-end Design

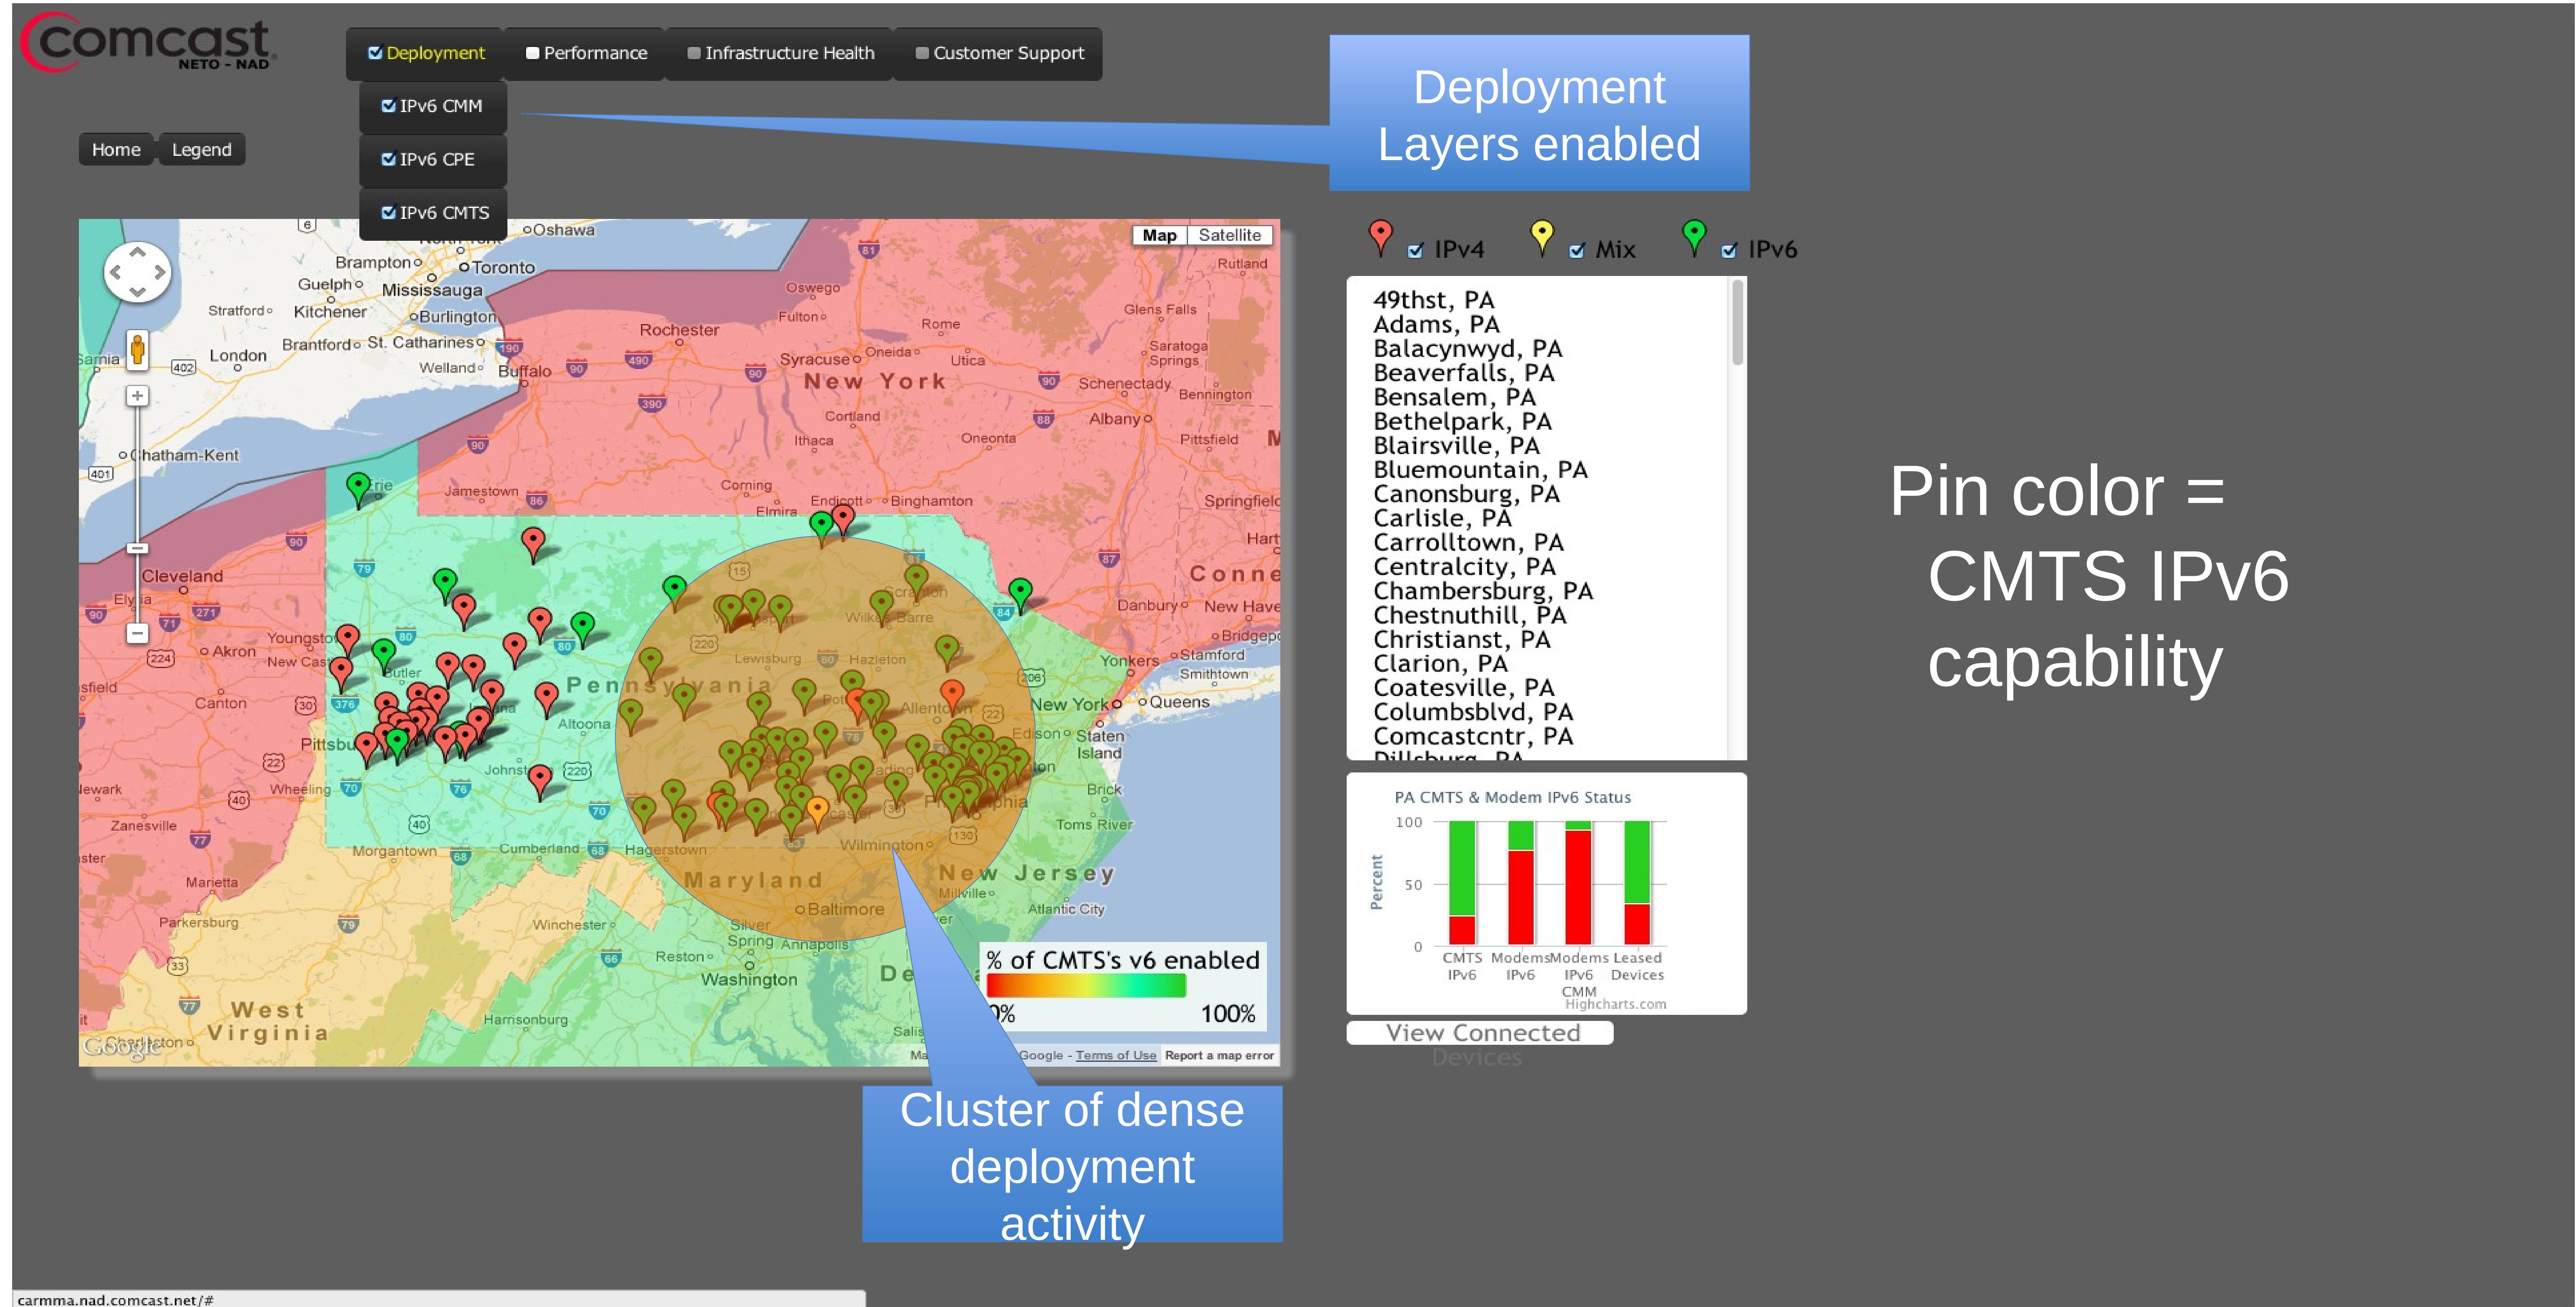

- Probes in one geographical area send data to local “Collectors”
  - Fast database insertions, avoid relational databases
  - In process of scaling-up performance
- Collectors “process” data for fault patterns, fault localization
- Scrub identifying info from data, upload highly reduced (aggregated) data set to Aggregation Server
  - Aggregated data ► trend analysis, fault forensics
- Data coherence is important

# Colored PetriNet Models of Probe + Back-end

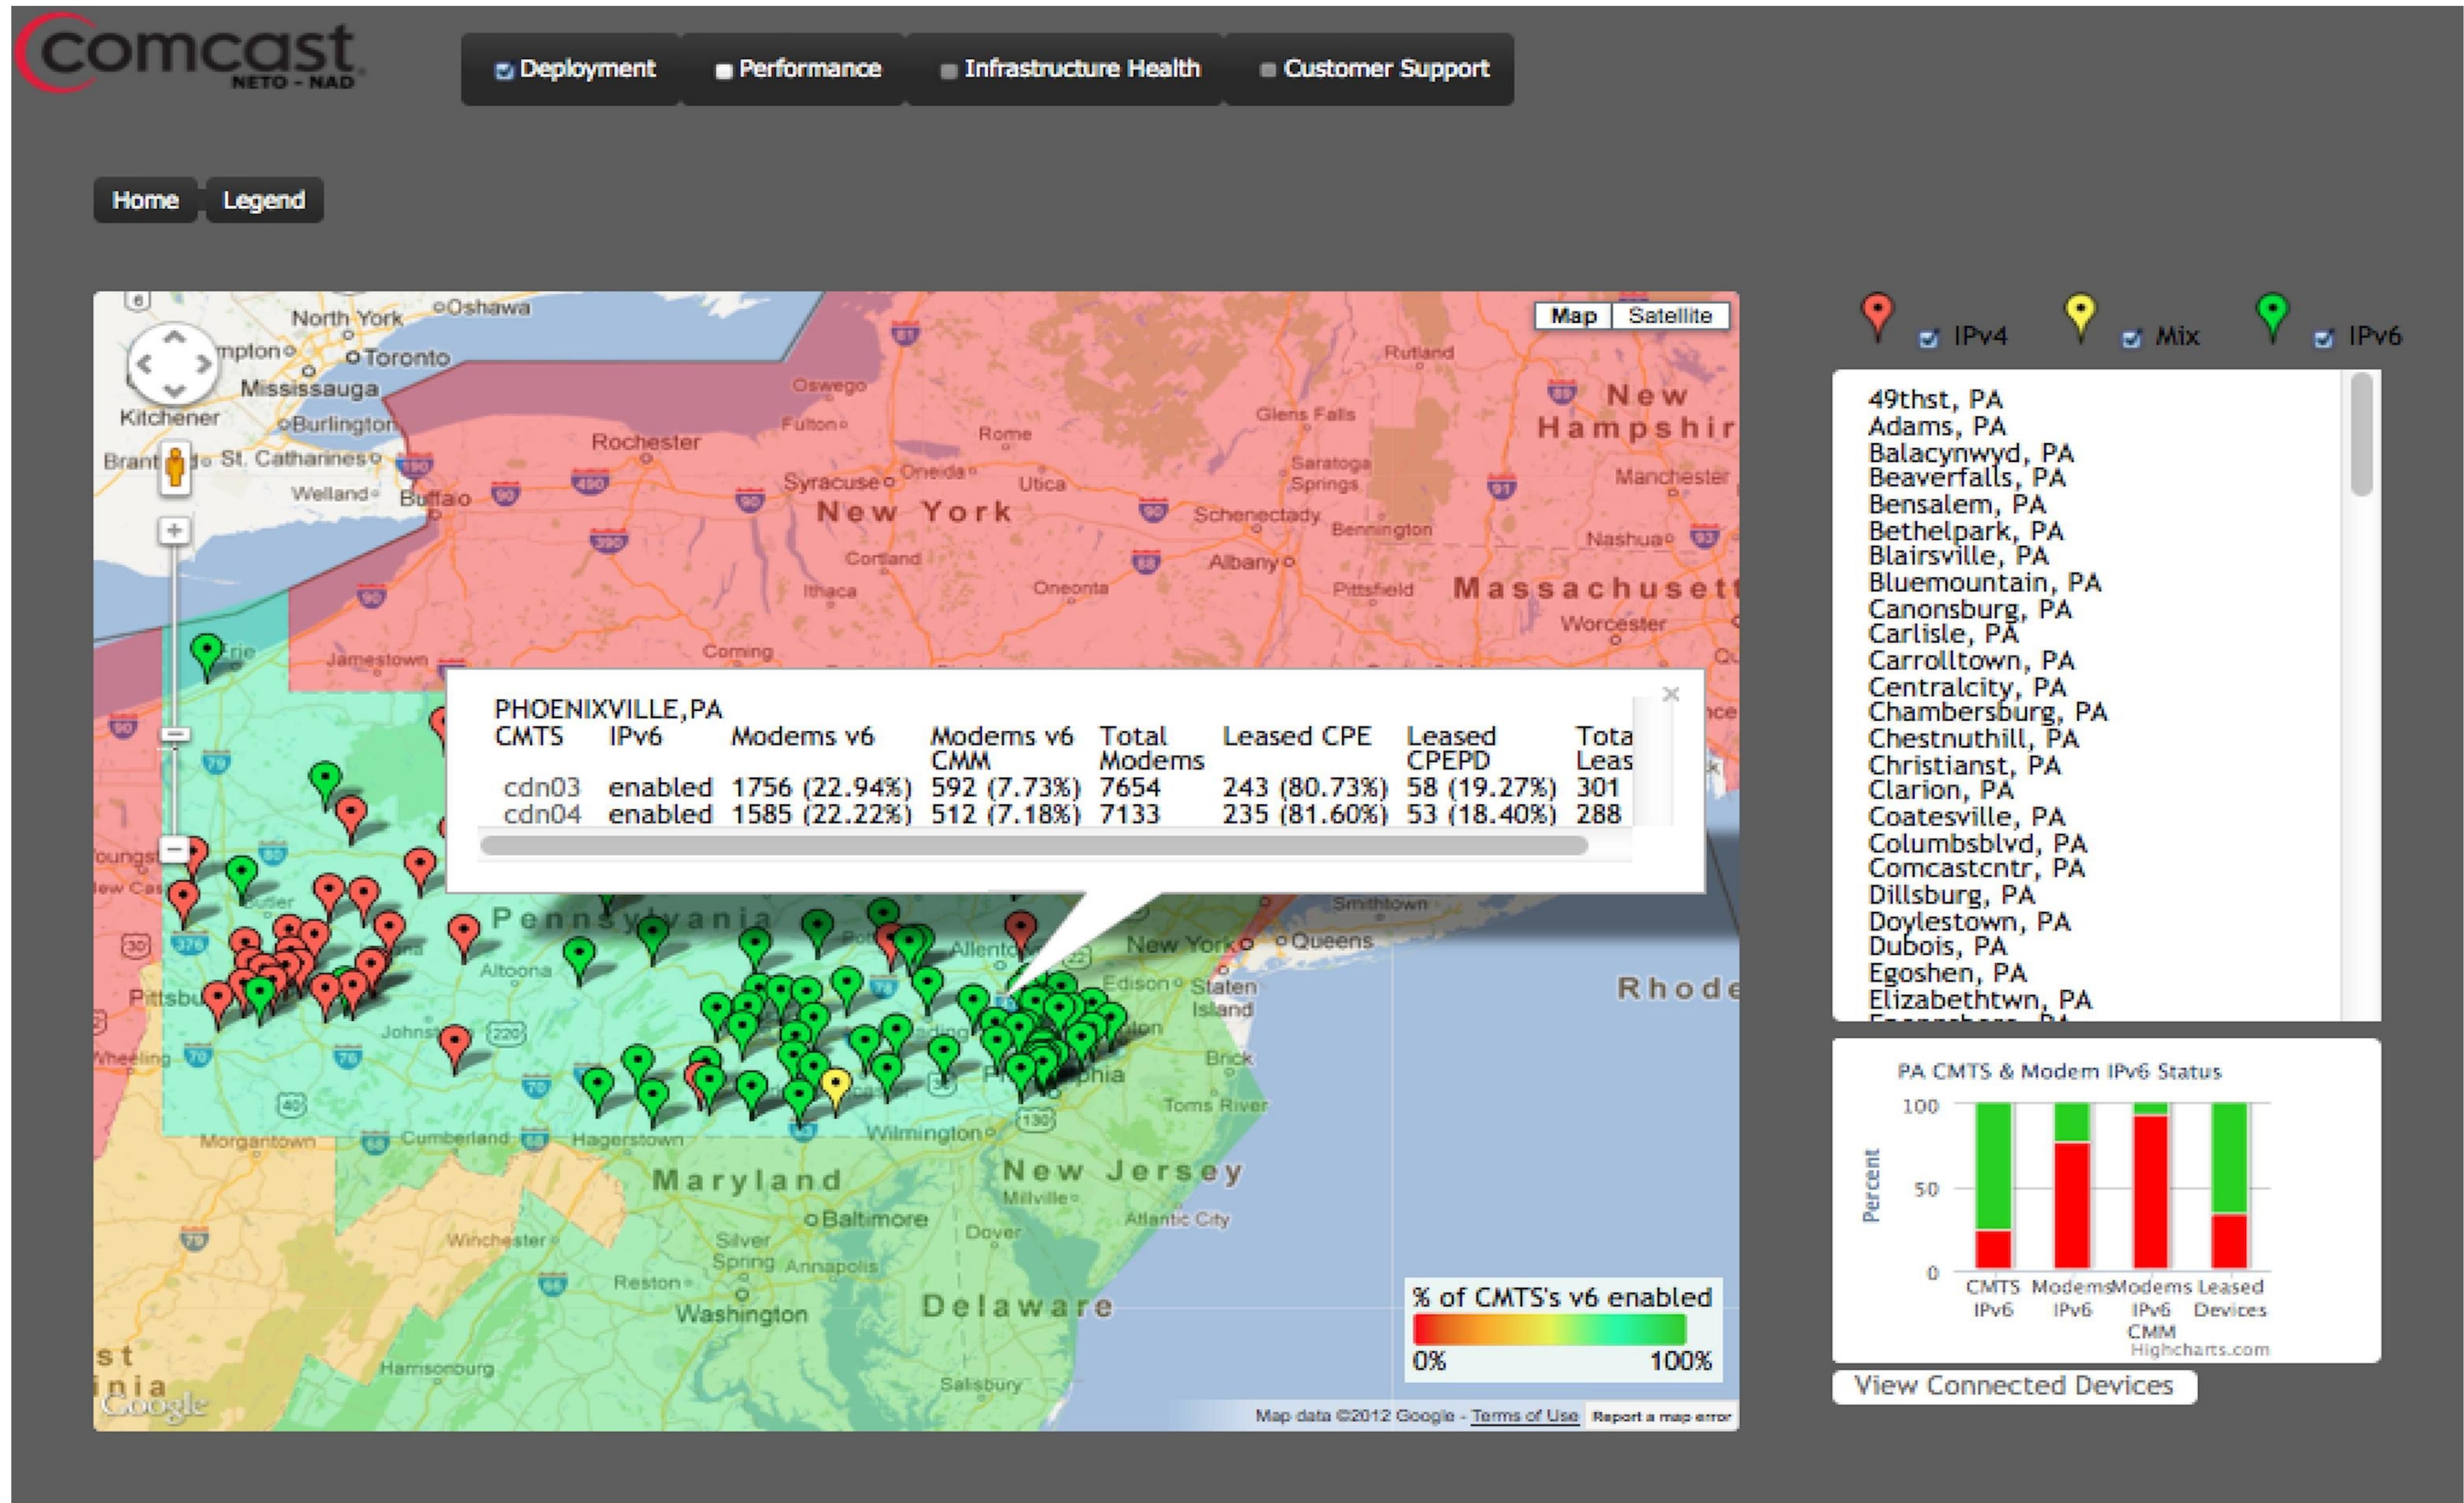

Note: Multi-level nesting of functional modules is possible

# Visualization: IPv6 Deployment, Region-wise

# Visualization: IPv6 Deployment, Zoomed-in

# IPv6 Performance: IPv6/IPv4 Site Latency Ratio

# Visualization: Cust. Support – Call Volumes, Truck Rolls

# Conclusion

- Architectural framework for
  - Fine-grained, end-to-end QoS measurements (bandwidth, delay, etc.)
  - Back-end support architecture for metric storage, processing and aggregation
  - Visualization front-end for presentation at multiple levels (customer service, engineering, executive functions)
- Fits-in with IPPP, LMAP broad architecture
- Can be expanded to fiber, DSL access networks, not just cable
- Proof of concept with valuable implementation lessons
