

ME6E-FP and ME6E-PR

draft-matsuhira-me6e-fp-00.txt

draft-matsuhira-me6e-pr-00.txt

Naoki Matsuhira

Fujitsu Limited

NVO3 WG, 94th IETF Yokohama, Nov. 2015

What is ME6E

- Multiple Ethernet - IPv6 address mapping encapsulation
 - Ethernet over IPv6 encapsulation technology
 - break VLAN limitation (4095)
 - unicast routing basis, not emulate learning bridge
 - possible L2 unicast communication without L3 multicast routing
- ME6E-FP and ME6E-PR
 - both use same address / frame format
 - FP(Fixed Prefix) for own routing domain
 - PR(Prefix Resolution) for own / non own routing domain

ME6E Frame format and ME6 address

■ ME6E Frame format

- Encapsulate Ethernet Frame with IPv6 header
- There is no Next header value represent “Ethernet”
 - Use EtherIP header ?
 - Request IANA to assign Next header value of “Ethernet”

■ ME6 address format (IPv6 address)

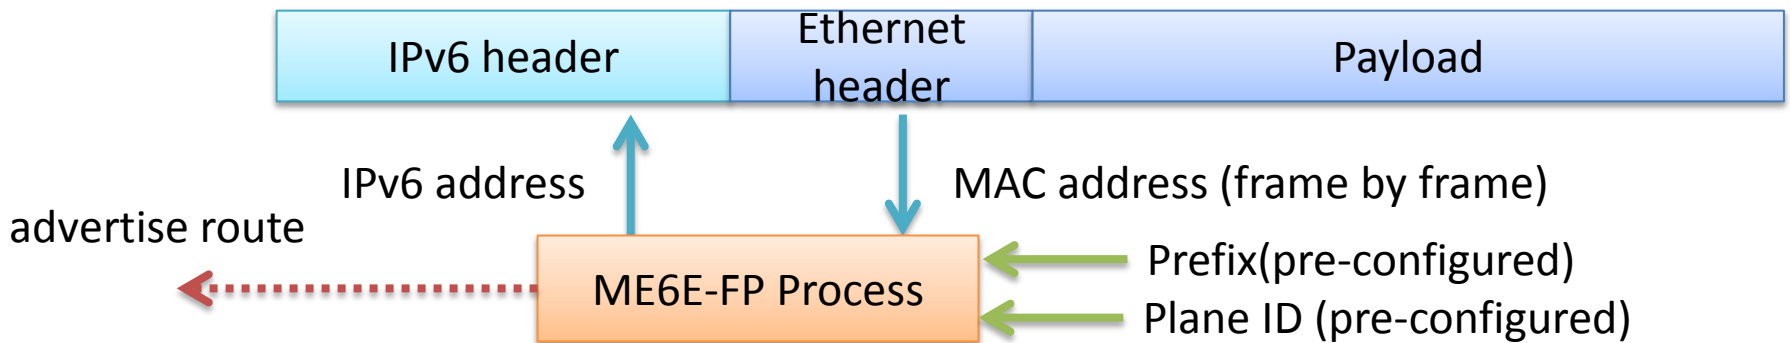

- Use both source and destination address
- Plane ID = VLAN-ID, tenant ID, VPN ID
 - 16bits Plane ID: 65535 (maybe not enough but better than 4095)
 - 32bits Plane ID: 4.3 billion (can forget limitation)
- How to resolve Prefix value?
 - ME6E-FP (fixed prefix) and ME6E-PR (prefix resolution)

ME6E-FP (fixed Prefix)

ME6 address format (IPv6 address)

ME6E-FP Processing

Communication with ME6E-FP

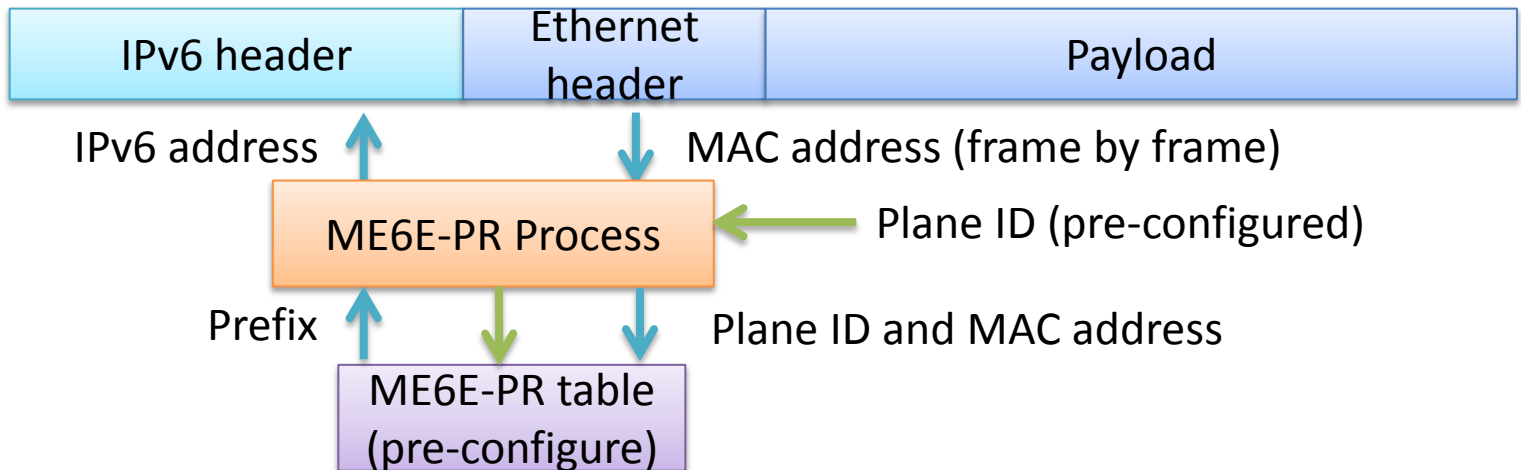

ME6E-PR (Prefix Resolution)

ME6 address format (IPv6 address)

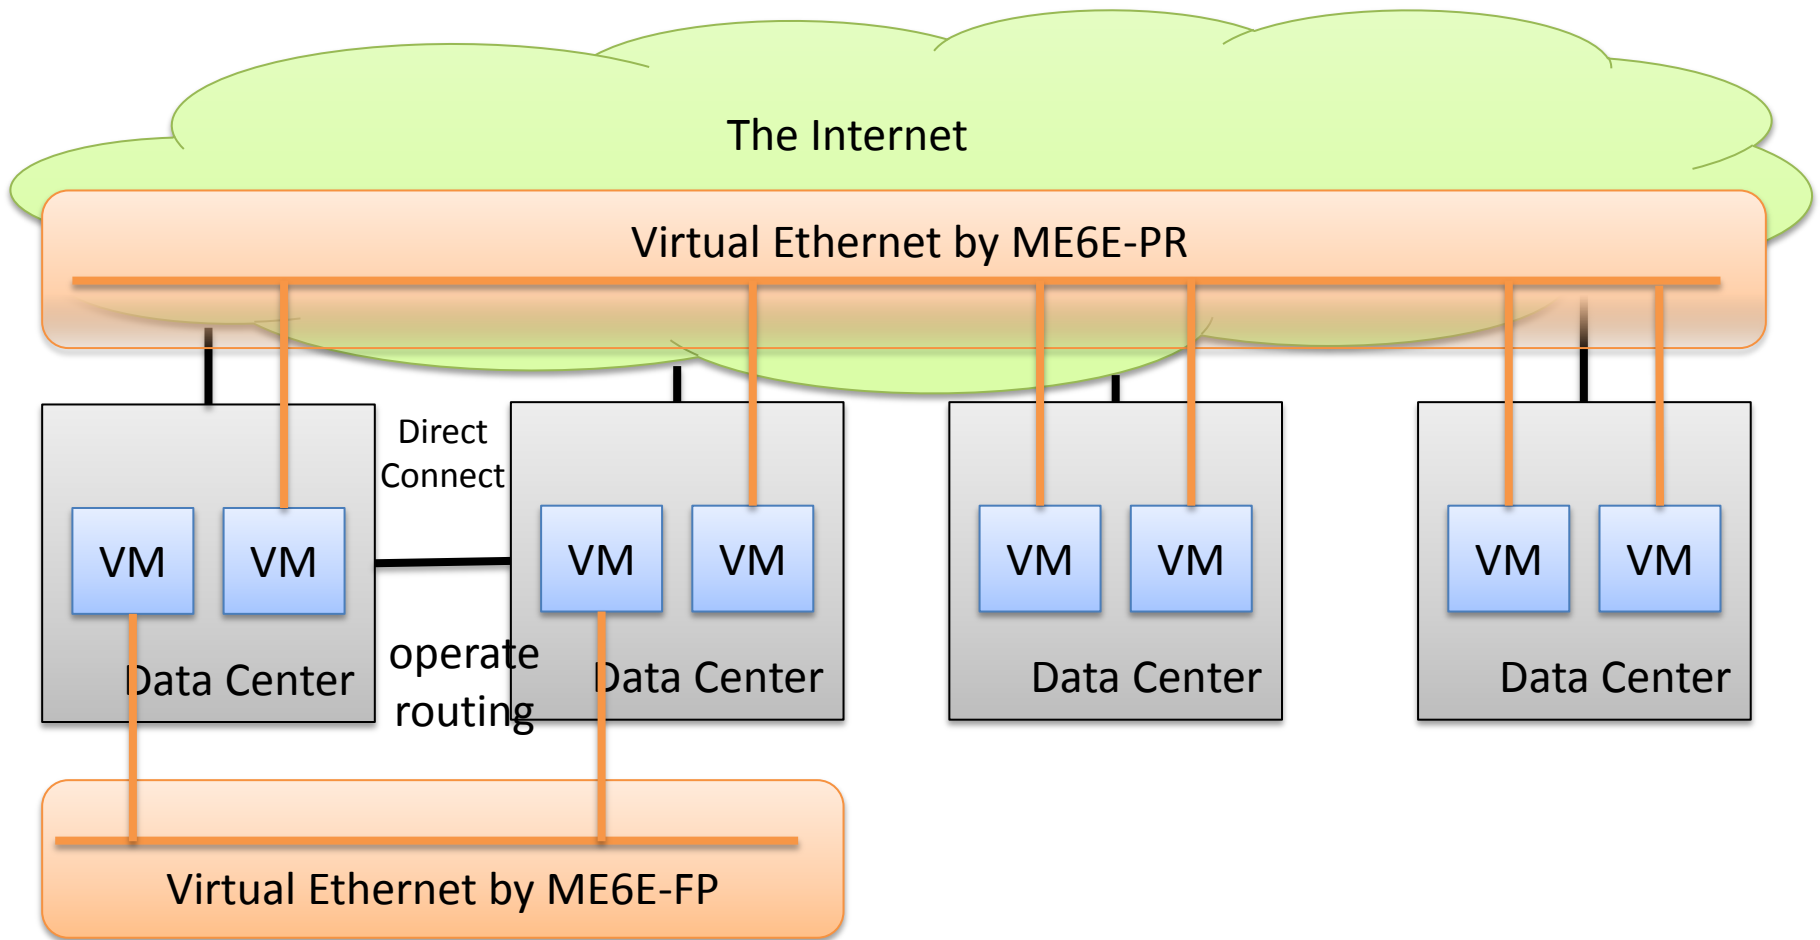

ME6E-PR Processing

Communication with ME6E-PR

Applicability of ME6E-FP and ME6E-PR

Next Step

- Now preparing related I-Ds (coming soon)
- Interest ?
- adapt WG item ?
