# Authentication Method Reference Values
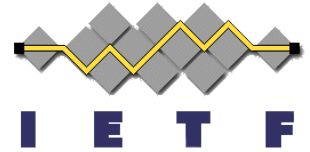

draft-jones-oauth-amr-values-02
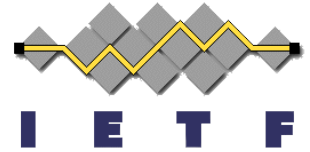

Mike Jones

IETF 94, Yokohama

November 2015

Defines registry and some values for "amr" JWT claim

- A simple spec that:
  - Records existing practice
  - Establishes registry for extensibility
- Values chosen because they are in actual use
  - List not intended to be exhaustive
- Example values:
  - "pwd" – Password
  - "rba" – Risk-based authentication

Next Steps

- Add rationale to document stating that values list intended to capture existing practice – not be exhaustive
  - The registry can be used for that

- Adoption by working group after recharter?
