at IETF 95 Buenos Aires, Argentina,  
on April 6th, 2016.

# 802.11p, and IPv6 over 802.11p

- 802.11p: an ammendment to 802.11 for Wireless Access in Vehicular Environments; if compared to WiFi:

- Operation Outside the Context of a BSS (OCB)
- New Timing Advertisement message (rolled into 802.11)
- Frequency range in the 5.9GHz band
- Approximate prohibition of IPv6 (== 'not safety'!) on channel 178 (180 in Europe)
- Half-rate encoding
- High power levels (33 dBm in Europe, 44 dBm in US)

- **IPv6 over 802.11p works as over e.g. 802.11b**

- MTU: default 1500 bytes
- Frame Format: Ethernet Adaptation Layer
- EtherType: 0x86DD, as with Ethernet
- Link-local Addresses, as with Ethernet (RFC2464)
- Address mapping, as with Ethernet
- Very frequent Router Advertisements may be necessary to ease IP handovers in OCB context, as with Mobile IPv6.

# Advancements since IET88 Vancouver

- 6man WG comments:
  - ND 6lowpan RFC6775 adapted for the subnet structure of networks of 802.11p links?
- v6ops WG comments:
  - The IID *may* be formed just like an IID for Ethernet (instead of 'is') -> **next rev.**
  - Referring or not to RFC2119, and the use of capitalized modal verbs -> **should we capitalize and refer to this RFC, or drop the ref?**
  - Use DNA RFC6059 instead of high-rate RAs? **Please suggest text.**
- 6lo WG comments:
  - RFC6568 6lowpan use-cases mention vehicular -> **not clear relationship to 802.11p**
- Private IEEE and IETF comments:
  - The use of a restricted reference to a IEEE P1609.2 document for security
    - **Should we or should we not drop the P1609.2 reference? Or as informative ref?**
- ISO TC204 WG16 comments:
  - Differences in EtherTypes for IPv6/p and for ISO protocols/p.
  - FNTTP-to-IP translators would be needed.
  - Minimal MTU recommendation similar to that of short WSMP messages (**what is that length?**)
