Diameter Domain and Arbitrary Mask Filters

draft-bertz-dime-domainmasks-00

L. Bertz

IETF 96, Berlin
DNS-Filters

Yet another extension of RFC 5777 for two purposes

- Add Query Domains to Filters
  - For Child Protections, Rating, etc. Operators side load flat files in production systems
  - Allows for a more dynamic, reactive solution
  - Uses the DNS Query Name (Qname) Format
  - NOT intended to help one break into DNSSEC connections (you need to be authorized to see the traffic here)
  - DNS-Filters ::= < AVP Header: TBD1 >
    1*{ <QNAMES> }
    * [ AVP ]
- Usage – Added to the RFC 5777 Classifier
SDN Related Filters

Yet another extension of RFC 5777 for two purposes

- Adds arbitrary masks for IP based and Flow-Label base filters
  - Aligns masks to what SDN technology can do
  - Permits improved matching, e.g. 0.0.5.0 – any subnet whose 3 octet is 5
  - We still recommend using prefixes when you have a prefix!

- AVPs
  - Flow-Label AVP Uint32 (but is 20 bits) (Why don't we have this already?)
  - Flow-Label-Mask-Pattern AVP (OctetString of binary mask)
  - IP-Address-Mask-Pattern AVP (OctetString of binary mask)

- Usage – Added to RFC 5777 To-Spec and From-Spec
Next Steps

• Have received a few (private) reviews with feedback but no mail list responses
  – Please provide feedback!
• Call for WG adoption
