

# draft--ecrit-lost-planned-changes

- Changes in data within a LoST server happens, usually planned events (like annexation)
- No way to push invalidation out to LIS, have to depend on periodic revalidation
- Draft proposes a new element to `<findService>` request:
  - URI to be saved with location
  - AsOf date to perform validation against
  - Also includes object pushed to LIS @ URI that contains AsOf invalidation date
- Adopted by WG, draft-ecrit...-00 issued
- Simple mechanism, ask for reviews and WGLC please
