

# Update and Demo on draft-irtf-nfvrg-unify-recursive-programming and draft-unify-sfc-control-plane-exp

Robert Szabo (Ericsson) and Balazs Sonkoly (BME)

NFVRG  
IETF 96

# draft-irtf-nfvrg-unify-recursive-programming

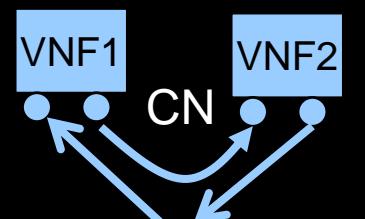

**“Atomic” joint configuration of**

- VNF placements
  - Defines **ports!!!**
- Forwarding definition
- Technology agnostic

Step 2: Overlay definition

Step 1: VNF deployment

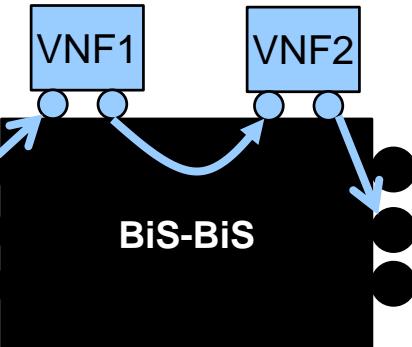

VIM

SDN Ctrl

VNF requests WITH forwarding definition (SFC)

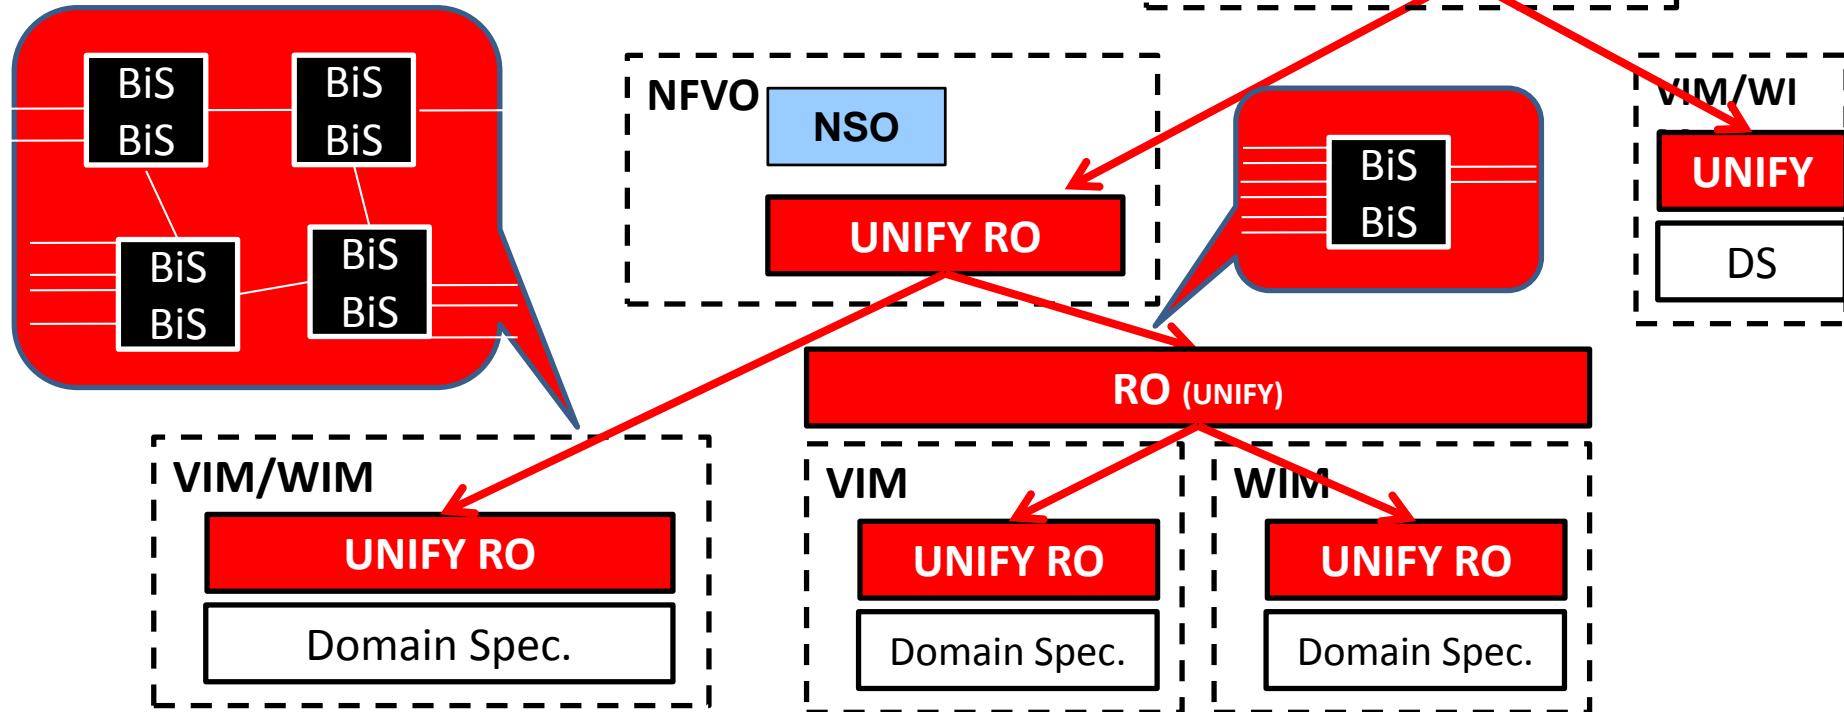

**Compute & Network Prog. API**

**Big Switch with Big Software (BiS-BiS)**

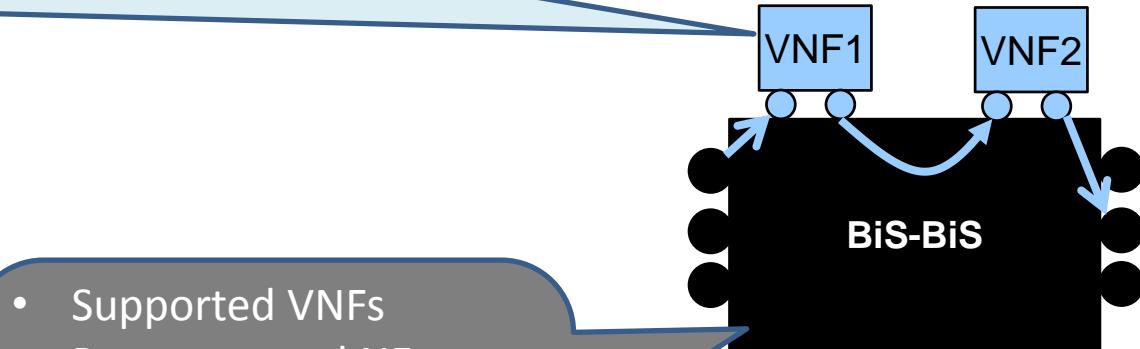

# Topology of BiS-BiS

(res: sw & net, cap, ...)

# Resources & Capabilities

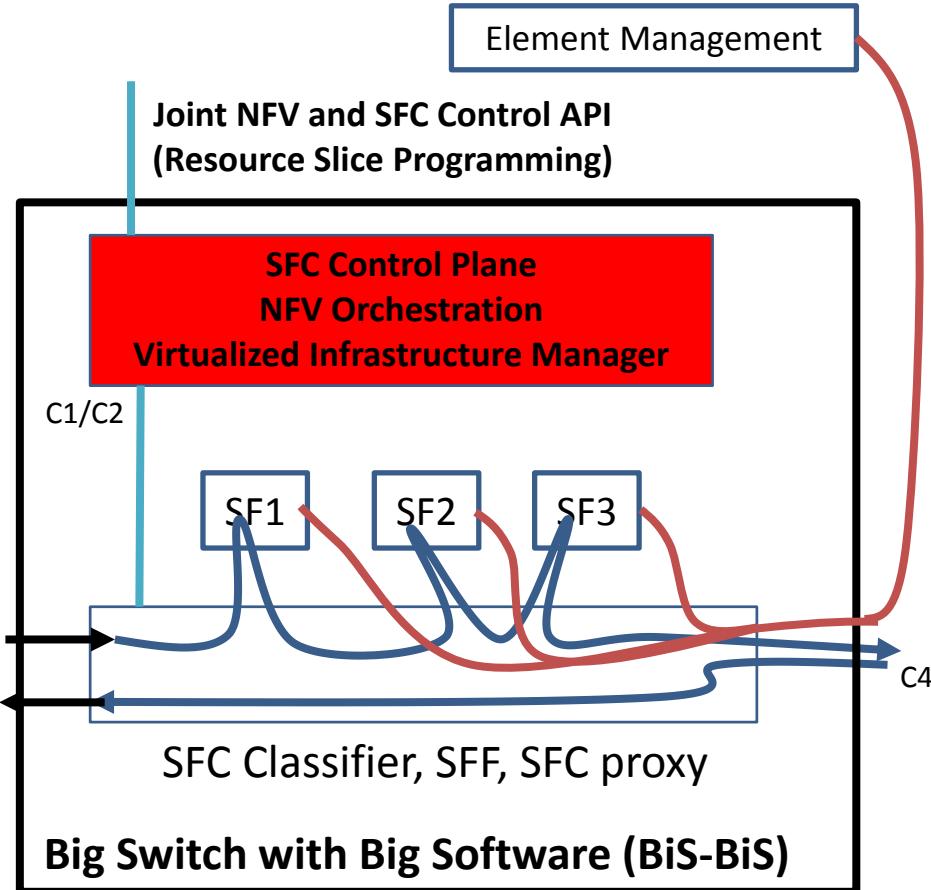

- VNF request
  - {cpu, mem, storage}
  - OR
  - {delay, bandwidth}
  - between any two VNF ports

- Supported VNFs
- Per supported NF type
  - {cpu, mem, storage} ↔ {delay, bandwidth}
  - between any two VNF ports

# draft-unify-sfc-control-plane-exp

- Combined control of NFV and Forwarding to realize SFC
- Can describe single node, nodes, domains, administrations, ...
- I-D: step-by-step 'transformation' of an SFC Control plane to the figure right

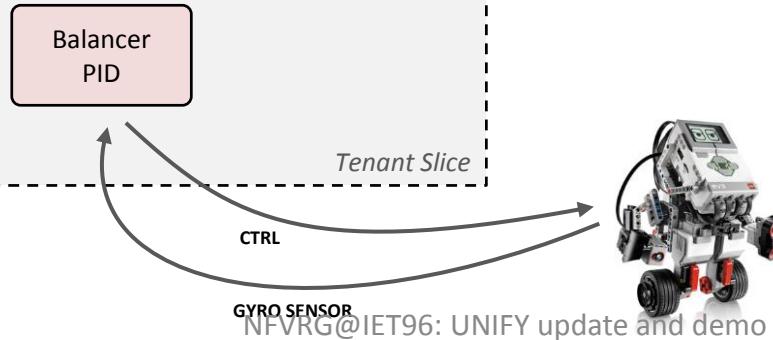

# Use-case

- Robot-local control
  - PID controller invoked every 20 ms

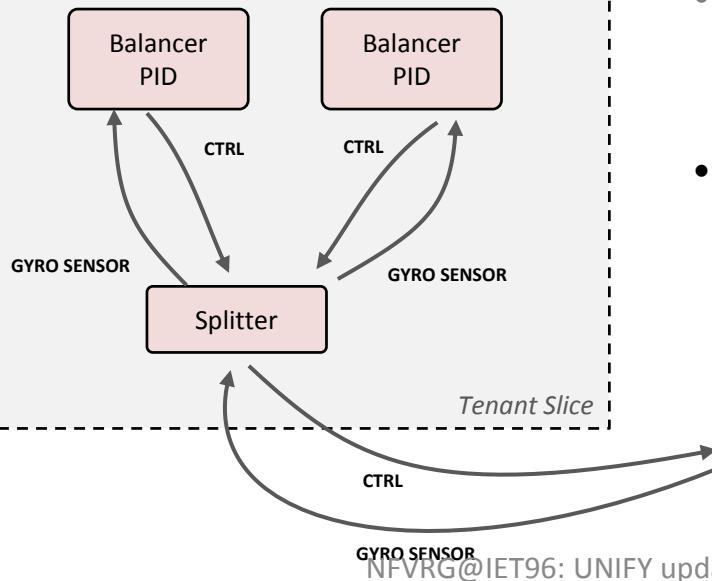

# Use-case

- Robot-local control
  - PID controller invoked every 20 ms
- Move the logic into the cloud
  - Robot requests control every 20 ms

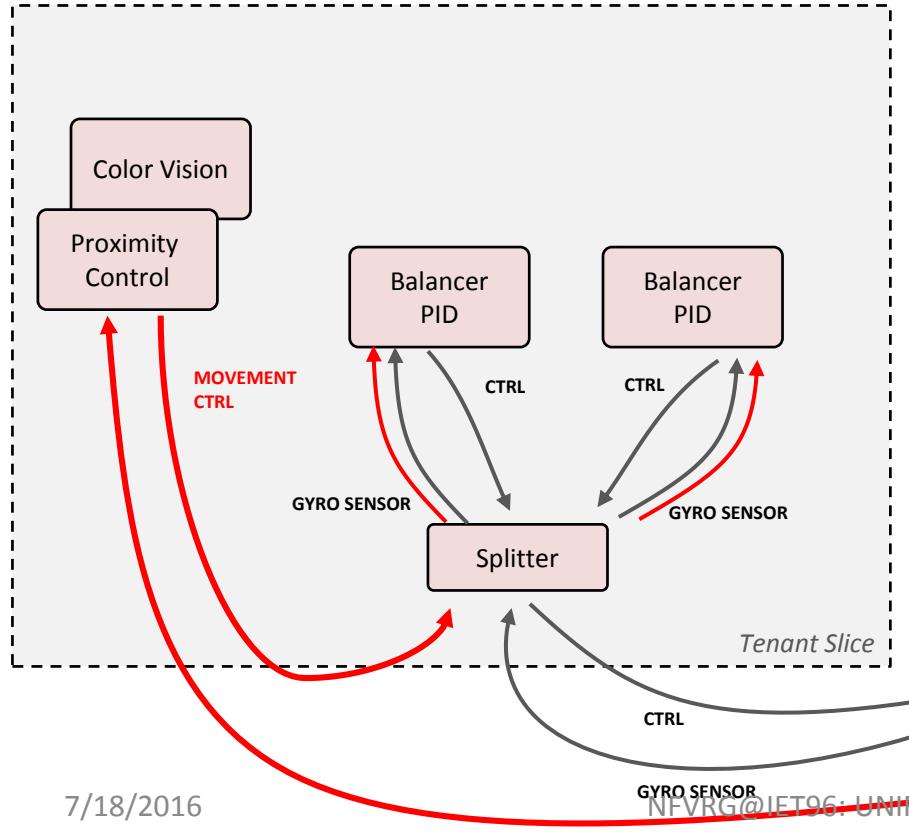

# Use-case

- Robot-local control
  - PID controller invoked every 20 ms
- Move the logic into the cloud
  - Robot requests control every 20 ms
- Enrich service:
  - Fault tolerance

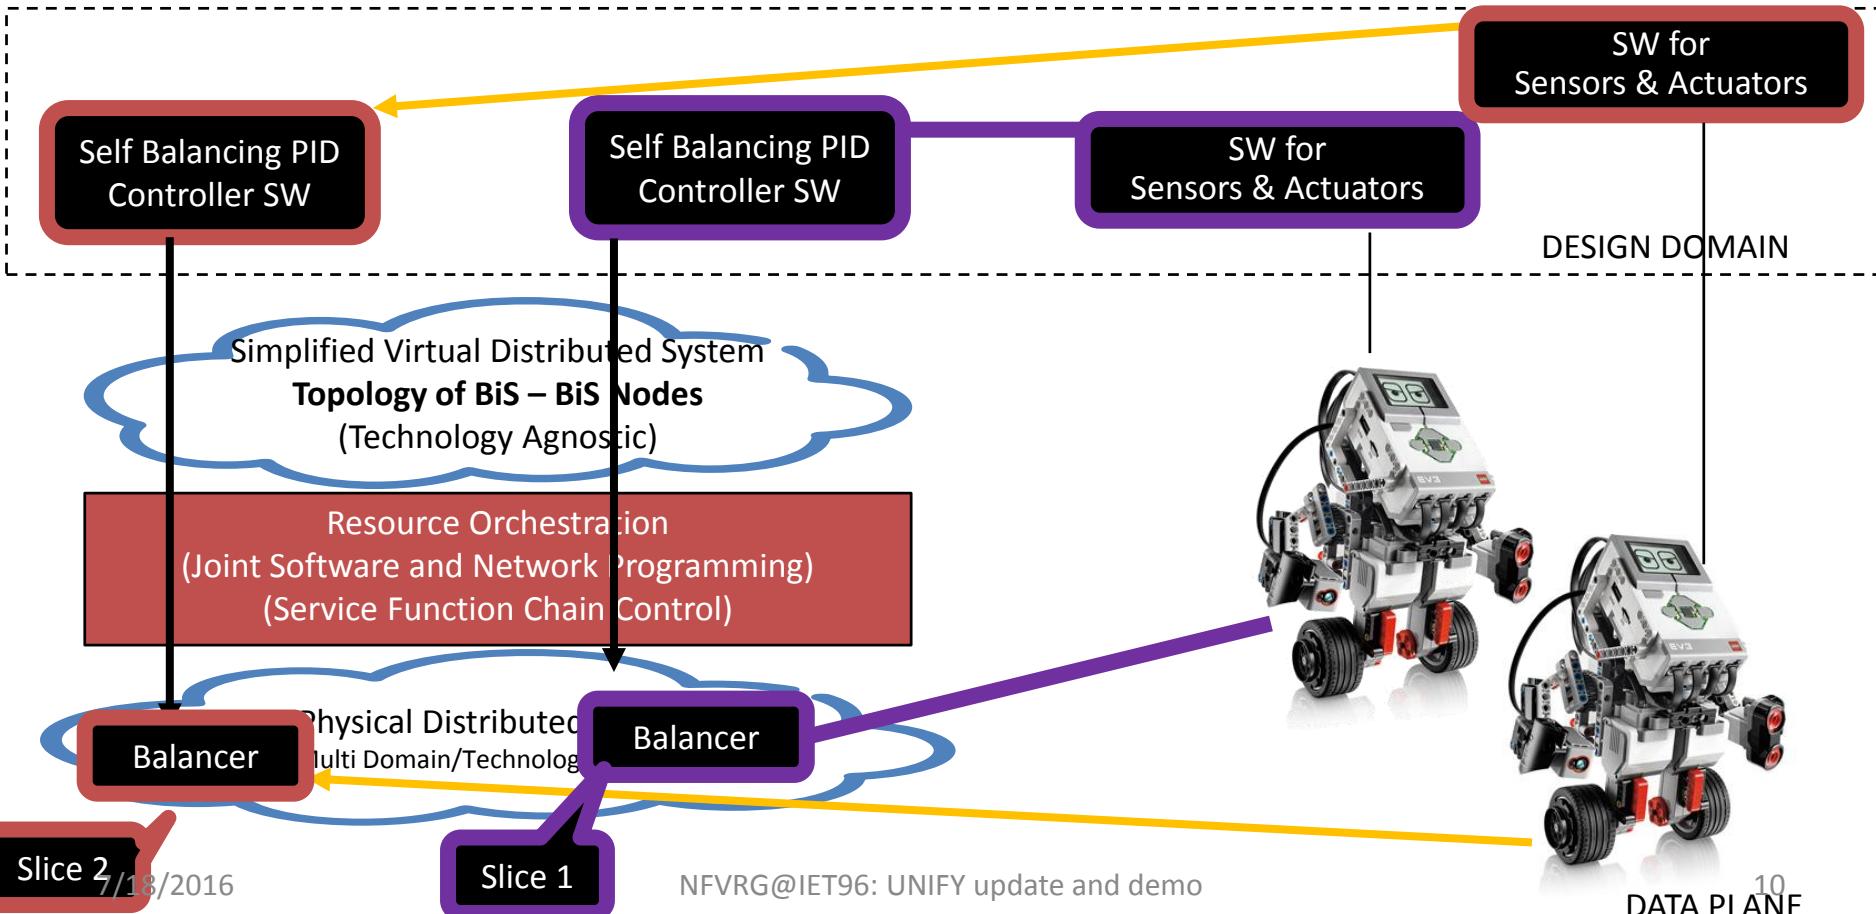

# Use-case

- Robot-local control
  - PID controller invoked every 20 ms
- Move the logic into the cloud
  - Robot requests control every 20 ms
- Enrich service:
  - Fault tolerance
  - Value added service functions

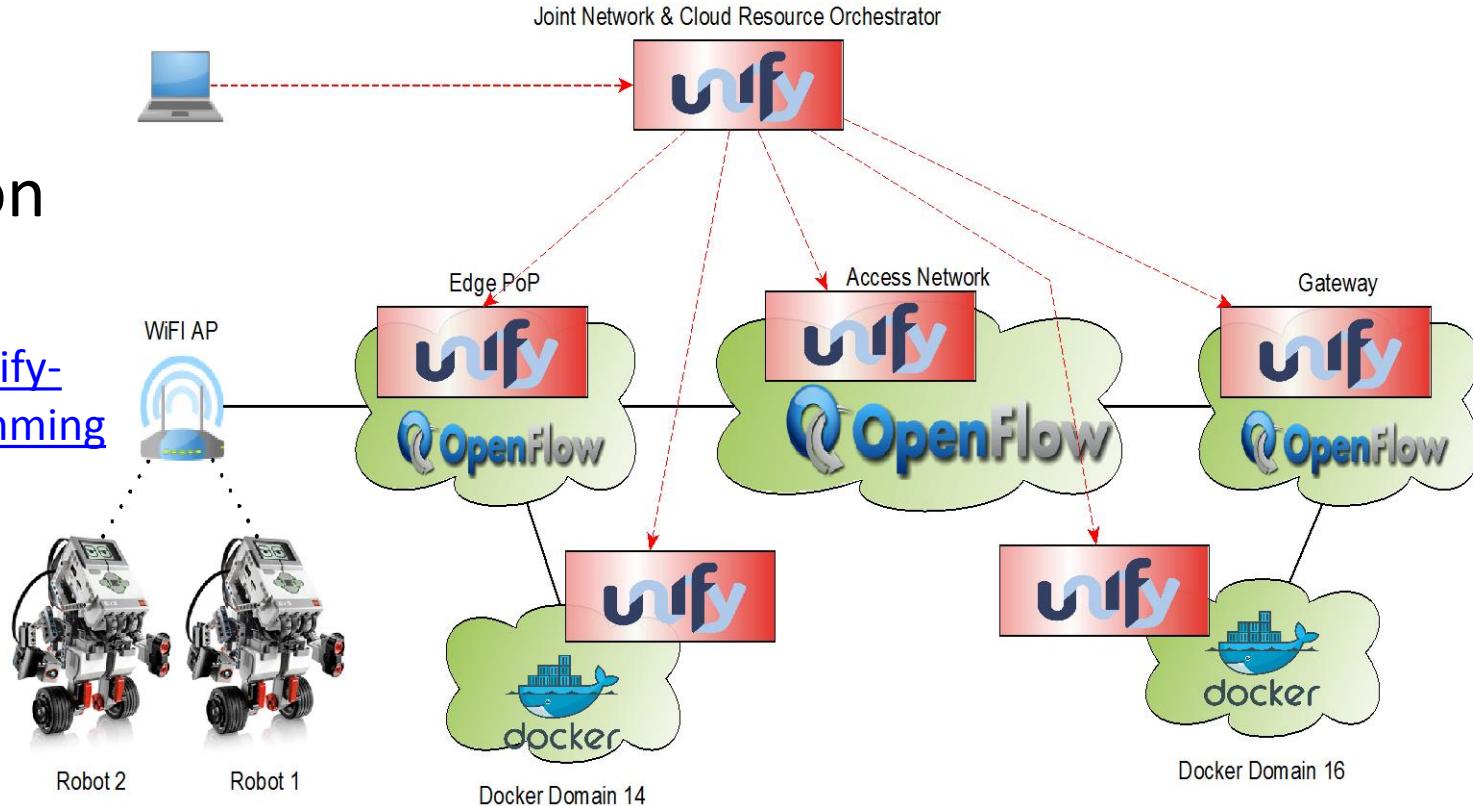

# SW to SFC: Joint Network & Cloud Programming

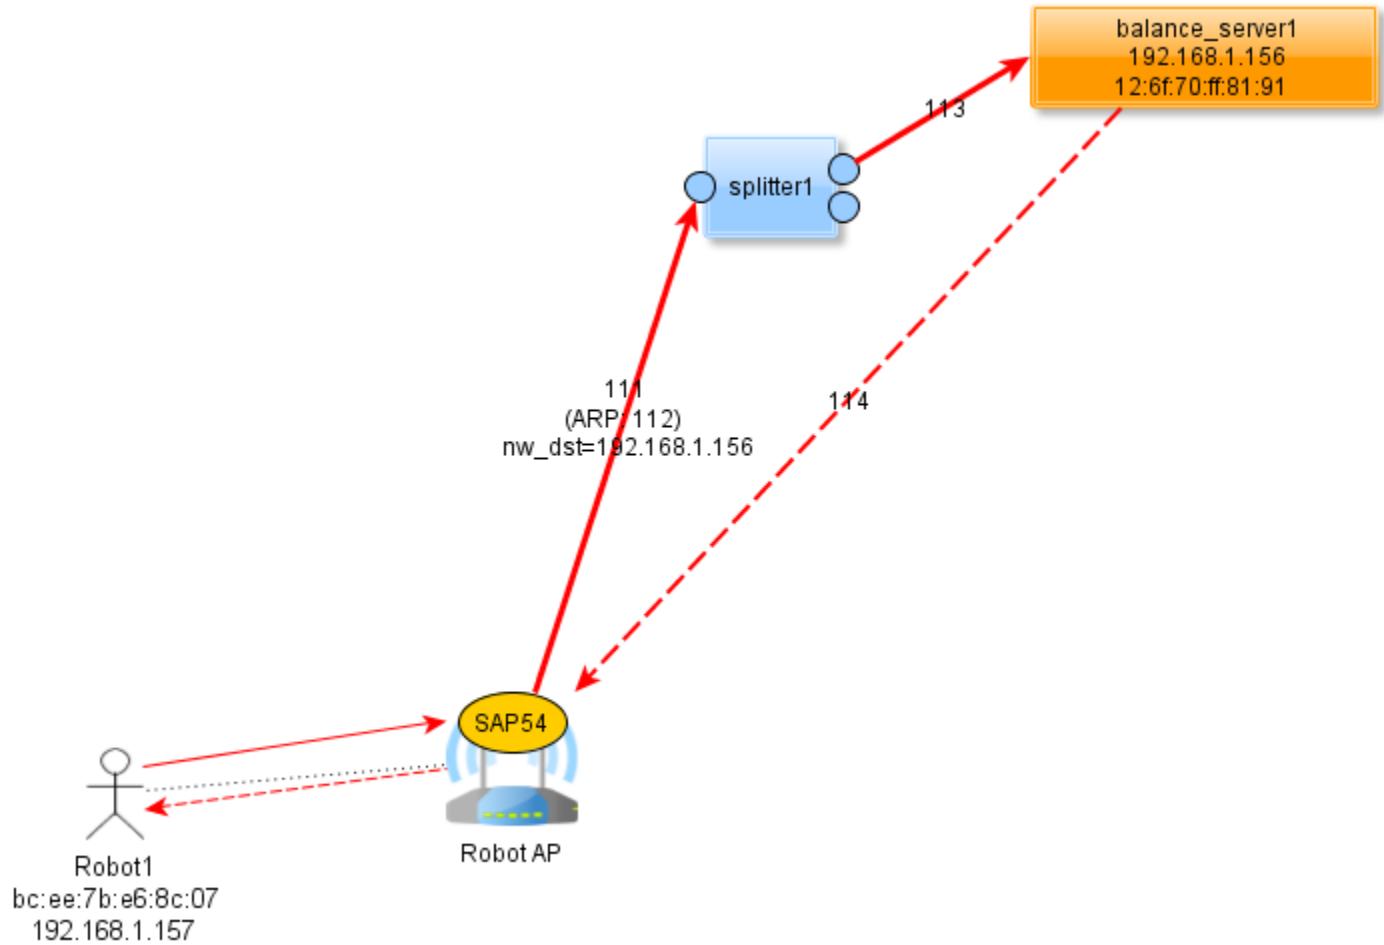

# Network Scenario

Recurring  
virtualization  
and control

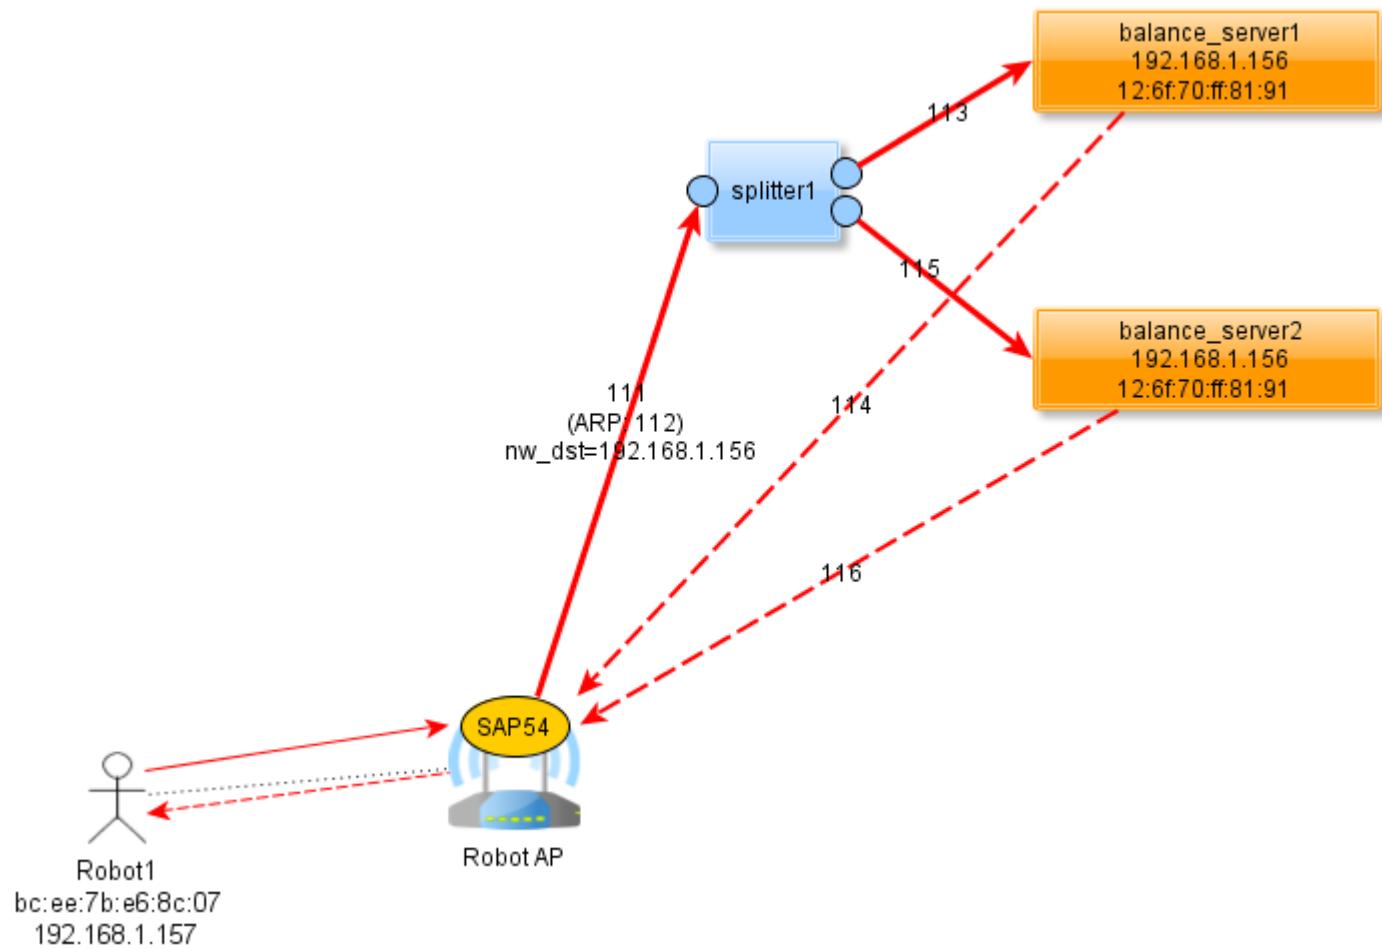

[draft-irtf-nfvrg-unify-recursive-programming](https://datatracker.ietf.org/doc/draft-irtf-nfvrg-unify-recursive-programming)

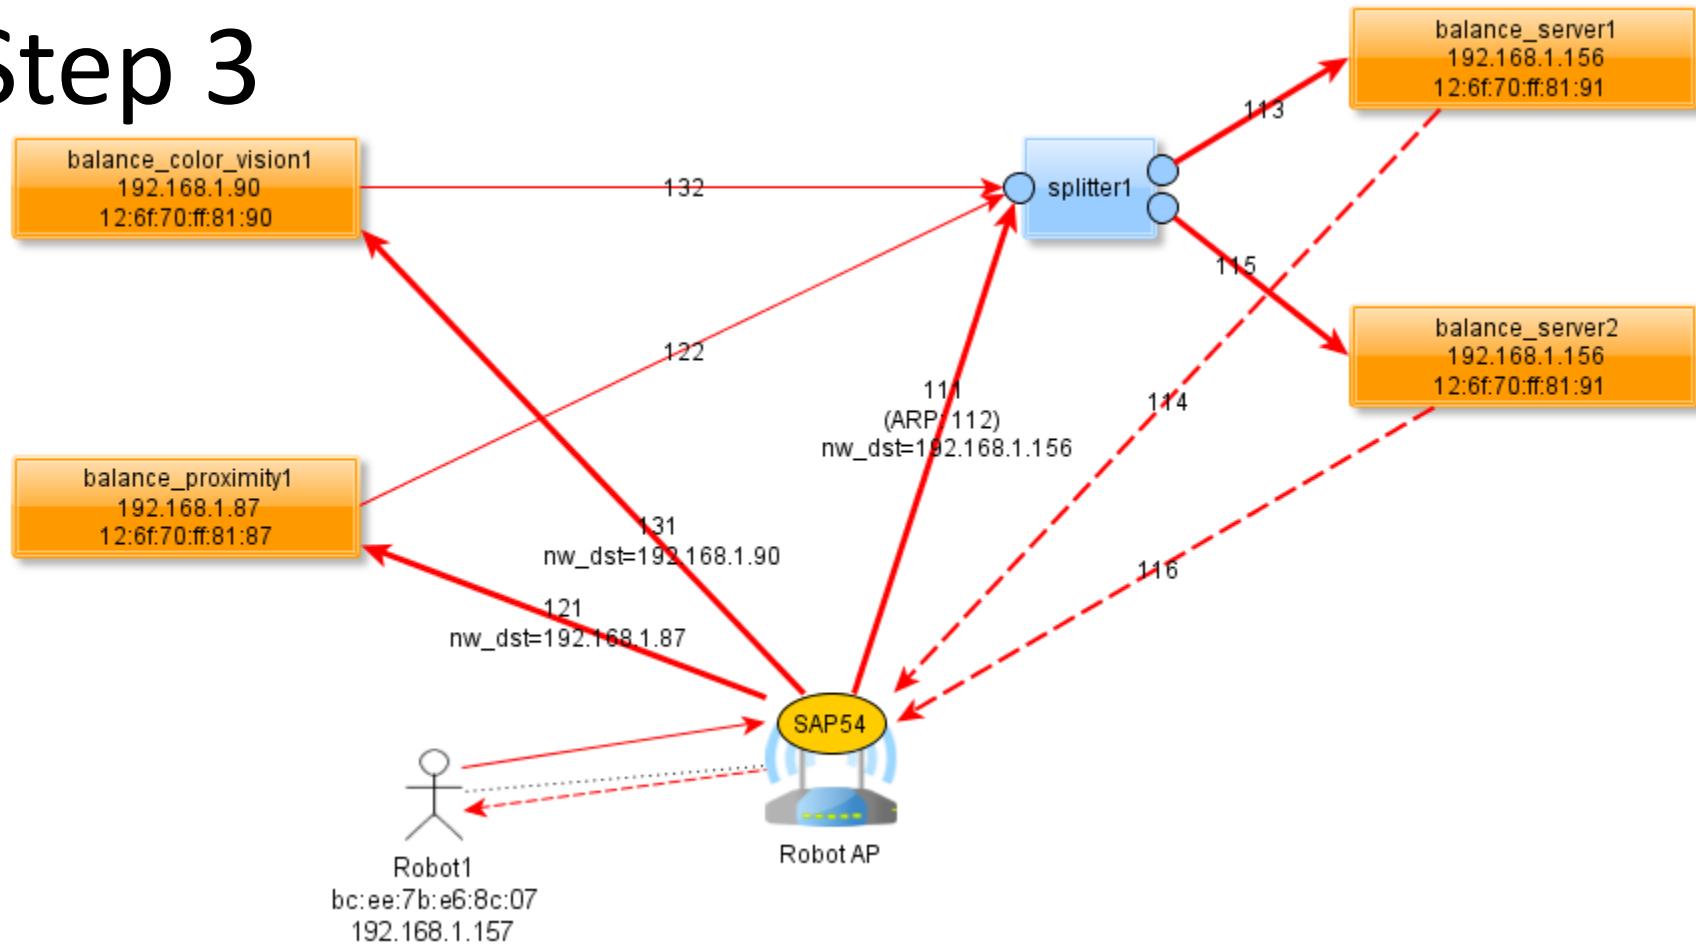

# Step 1

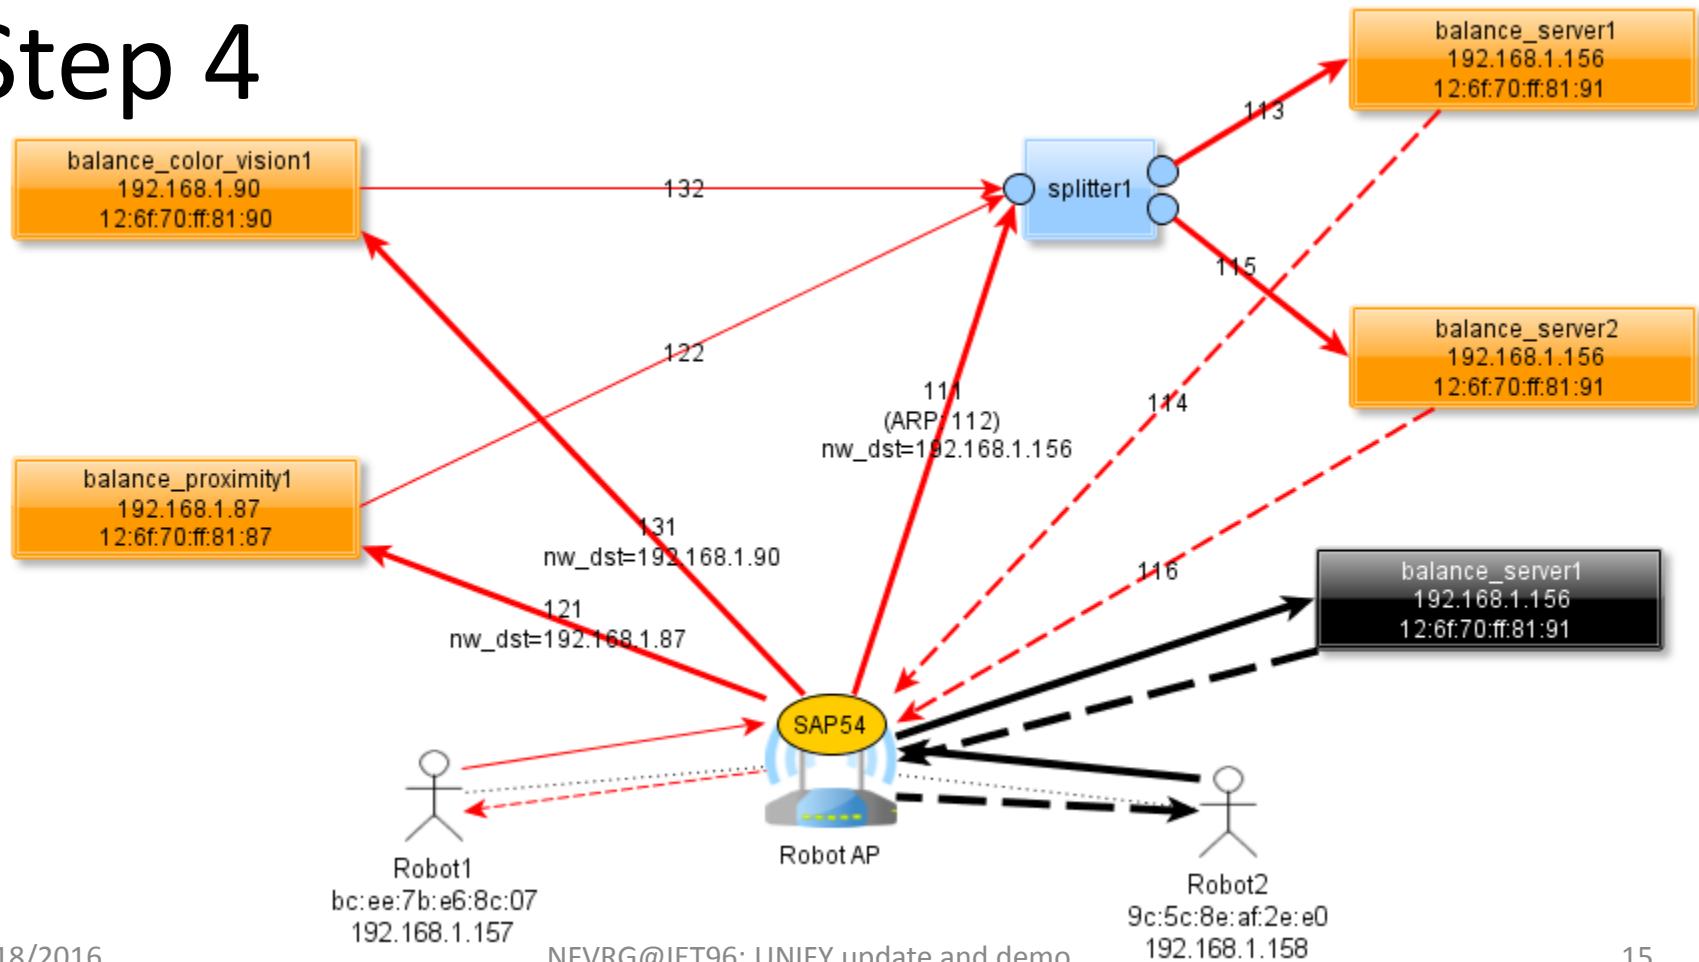

# Step 2

# Step 3

# Step 4

# UNIFY Demos @ Bits'n'bites

- Flexible Service Function Chain orchestration and control in multi-technology and multi-domain environments [[draft-unify-sfc-control-plane-exp](#)]
- An Elasticity Control API of the UNIFY Resource Orchestrator with a Control and Data Plane split VNF (an elastic router) based on the joint software and network programming API [[draft-irtf-nfvrg-unify-recursive-programming](#)] → Elastic Router
- Dynamic aggregation [[draft-cai-nfvrg-recursive-monitor](#)] for results from low-overhead passive SDN measurements

# Summary

## I-D

- Recurring domain virtualization and control
- Resources and Capabilities

## Implementation

- Multi technology/domain support
  - OpenStack, Docker, SDN
- Network Slicing
- Automated:
  - SW defined apps
  - Service Function Chain
  - Network Slice
