MSDP YANG

- This YANG module is reach a preliminary consensus in the YANG multicast design team.
- Archive: <http://www.ietf.org/mail-archive/web/yang-multicast/current/maillist.html>
- Wiki:
<http://trac.tools.ietf.org/wg/pim/trac/wiki/yang>
- This draft is versioned on github:
<https://github.com/mcallisterjp/pim-yang/>

MSDP YANG

- According to RFC3618 [Multicast Source Discovery Protocol (MSDP)]
- Scope covers MSDP protocol and commonly used configuration

- Defines a YANG data model for MSDP configuration and operation

High-level structure done

Configuration attributes done

Operational state attributes done

Statistics attributes done

RPC attributes done

Still to do:

- Notifications
- Further review

MSDP configuration

augment /rt:routing/rt:control-plane-protocols:

+--rw msdp!

+--rw global

.....

+--rw peers

.....

Two level:

Global: General configuration for the entire protocol.

Peer: Special configuration for every MSDP peer.

```
+--rw msdp!
  +-rw global
    | +-rw connect-source? if:interface-ref
    | +-rw default-peer! {global-default-peer}?
    |   | +-rw peer-addr    -> ../../peers/peer/address
    |   | +-rw prefix-policy? string {global-default-peer-policy}?
    | +-rw originating-rp
    |   | +-rw interface? if:interface-ref
    | +-rw sa-filter
    |   | +-rw in?  string
    |   | +-rw out? string
    | +-rw ttl-threshold? uint8
```

- Connect-source: The interface is to be the source for the TCP connection.
- Default-peer: The default peer accepts all MSDP SA messages. The reverse path forwarding (RPF) check on SA messages can fail, and no SA messages are accepted. We can use a default peer and bypass RPF checks.
- Originating-rp: This parameter can be used to define a unique IP address for the RP of each MSDP peer.
- Sa-filter: Specifies an access control list (ACL) to filter source active (SA) messages.
- Ttl-threshold: Maximum number of hops data packets can traverse before being dropped.

MSDP configuration

- Authentication: Commonly used authentication attributes.
- Enable: Same usage with BGP protocol.
- Mesh-group: The mesh group that the peer belongs.
- Peer-as: Peer's autonomous system number (ASN).
- Timer: The timer definition according to RFC3618.

```
+--rw peers
  +-rw peer* [address]
    +-rw address      inet:ipv4-address
    +-rw authentication
      | +-rw (authentication-type)?
      | +-:(key-chain) {peer-key-chain}?
      | | +-rw key-chain? key-chain:key-chain-ref
      | +-:(password) {peer-key-chain}?
      | | +-rw key?      string
    +-rw enable?      boolean {peer-admin-enable}?
    +-rw connect-source? if:interface-ref
    +-rw description? string {peer-description}?
    +-rw mesh-group?   string
    +-rw peer-as?      string {peer-as}?
    +-rw sa-filter
      | +-rw in?      string
      | +-rw out?     string
    +-rw timer
      | +-rw connect-retry-interval? uint16 {peer-timer-connect-retry}?
      | +-rw holdtime-interval?     uint16 {peer-timer-holdtime}?
      | +-rw keepalive-interval?   uint16 {peer-timer-keepalive}?
    +-rw ttl-threshold?   uint8
```

MSDP state

augment /rt:routing-state/rt:control-plane-protocols:

```
+--ro msdp!
  +-+ro global
    .....
  +-+ro peers
    .....
  +-+ro sa-cache
    .....
```

Three levels:

Global: The same as configuration.

Peer: Include the peer configuration and statistics.

Sa-cache: SA cache state attributes.

```
+--ro sa-cache
  +-+ro entry* [group source-addr]
    +-+ro group      inet:ipv4-address
    +-+ro source-addr  union
    +-+ro origin-rp* [rp-address]
      | +-+ro rp-address  inet:ip-address
      | +-+ro is-local-rp?  boolean
      | +-+ro sa-adv-expire?  uint32
    +-+ro up-time?      uint32
    +-+ro expire?       uint32
    +-+ro holddown-interval?  uint32
    +-+ro peer-learned-from?  inet:ipv4-address
    +-+ro rpf-peer?       inet:ipv4-address
```

Group: The group address of this sa cache.

Source-addr: The source addr of this sa cache.

Origin-rp: The rp information.

Up-time: The up time of this sa cache.

Expire: The expire time of this sa cache.

Holddown-interval: Holddown timer value for SA forwarding.

Peer-learned-from: The address of peer that we learned this SA from.

Rpf-peer: RPF peer.

MSDP state

Peer state:

- Session-state: Per peer state attributes for MSDP.
- Elapsed-time: Elapsed time for being in a state.
- Connect-retry-expire: Connect retry expire time of peer connection.
- Hold-expire: Hold expire time of peer connection.
- Is-default-peer: If this peer is default peer.
- Keepalive-expire: Keepalive expire time of this peer.
- Reset-count: The reset count of this peer.
- Statistics: Include the statistics information of received and sent. And other relative information.

```
+--ro peers
.....
|   +-+ro session-state?      enumeration
|   +-+ro elapsed-time?      uint32
|   +-+ro connect-retry-expire?  uint32
|   +-+ro hold-expire?      uint32
|   +-+ro is-default-peer?    boolean
|   +-+ro keepalive-expire?    uint32
|   +-+ro reset-count?      uint32
|   +-+ro statistics
|       +-+ro discontinuity-time? yang:date-and-time
|       +-+ro error
|           +-+ro rpf-failure?  uint32
|       +-+ro queue
|           +-+ro size-in?     uint32
|           +-+ro size-out?    uint32
|       +-+ro received
|           +-+ro keepalive?    yang:counter64
|           +-+ro notification? yang:counter64
|           +-+ro sa-message?   yang:counter64
|           +-+ro sa-response?  yang:counter64
|           +-+ro sa-request?   yang:counter64
|           +-+ro total?        yang:counter64
|       +-+ro sent
|           +-+ro keepalive?    yang:counter64
|           +-+ro notification? yang:counter64
|           +-+ro sa-message?   yang:counter64
|           +-+ro sa-response?  yang:counter64
|           +-+ro sa-request?   yang:counter64
|           +-+ro total?        yang:counter64
```

MSDP rpc

rpcs:

```
+---x msdp-clear-peer
| +---w input
|   +---w peer-address?  inet:ipv4-address
+---x msdp-clear-sa-cache {rpc-clear-sa-cache}?
  +---w input
    +---w entry!
      | +---w group      inet:ipv4-address
      | +---w source-addr?  union
      +---w peer-address?  inet:ipv4-address
      +---w peer-as?      string
```

RPC includes the operation of clearing peer and sa-cache.

MSDP YANG

- Any comments are welcome 😊

Thanks!
