TLS Client and Server Models  
draft-ietf-netconf-tls-client-server-02

Abstract

This document defines three YANG modules: the first defines groupings for a generic TLS client, the second defines groupings for a generic TLS server, and the third defines common identities and groupings used by both the client and the server. It is intended that these groupings will be used by applications using the TLS protocol.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

This document contains references to other drafts in progress, both in the Normative References section, as well as in body text throughout. Please update the following references to reflect their final RFC assignments:

- o I-D.ietf-netconf-keystore

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- o "XXXX" --> the assigned RFC value for this draft
- o "YYYY" --> the assigned RFC value for I-D.ietf-netconf-keystore

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- o "2017-03-13" --> the publication date of this draft

The following two Appendix sections are to be removed prior to publication:

- o Appendix A. Change Log

- o Appendix B. Open Issues

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 14, 2017.

## 1. Introduction

This document defines three YANG [RFC7950] modules: the first defines a grouping for a generic TLS client, the second defines a grouping for a generic TLS server, and the third defines identities and groupings common to both the client and the server (TLS is defined in [RFC5246]). It is intended that these groupings will be used by applications using the TLS protocol. For instance, these groupings could be used to help define the data model for an HTTPS [RFC2818] server or a NETCONF over TLS [RFC7589] based server.

The client and server YANG modules in this document each define one grouping, which is focused on just TLS-specific configuration, and specifically avoids any transport-level configuration, such as what ports to listen-on or connect-to. This enables applications the opportunity to define their own strategy for how the underlying TCP connection is established. For instance, applications supporting NETCONF Call Home [RFC8071] could use the grouping for the TLS parts it provides, while adding data nodes for the TCP-level call-home configuration.

### 1.1. Terminology

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

## 1.2. Tree Diagrams

A simplified graphical representation of the data models is used in this document. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Braces "{" and "}" enclose feature names, and indicate that the named feature must be present for the subtree to be present.
- o Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "\*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

## 2. The TLS Client Model

The TLS client model presented in this section contains one YANG grouping, to just configure the TLS client omitting, for instance, any configuration for which IP address or port the client should connect to.

This grouping references data nodes defined by the keystore model [I-D.ietf-netconf-keystore]. For instance, a reference to the keystore model is made to indicate which trusted CA certificate a client should use to authenticate the server's certificate.

### 2.1. Tree Diagram

The following tree diagram presents the data model for the grouping defined in the ietf-tls-client module. Please see Section 1.2 for tree diagram notation.

```

module: ietf-tls-client
groupings:
  tls-client-grouping
    +----- server-auth
    |   +----- trusted-ca-certs?
    |   |           -> /ks:keystore/trusted-certificates/name
    |   +----- trusted-server-certs?
    |   |           -> /ks:keystore/trusted-certificates/name
    +----- client-auth
    |   +----- (auth-type)?
    |   |   +---:(certificate)
    |   |   +----- certificate?   leafref
    +----- hello-params {tls-client-hello-params-config}?
    |   +----- tls-versions
    |   |   +----- tls-version*   identityref
    +----- cipher-suites
    |   +----- cipher-suite*   identityref

```

## 2.2. Example Usage

This section shows how it would appear if the `tls-client-grouping` were populated with some data. This example is consistent with the examples presented in Section 2.2 of [I-D.ietf-netconf-keystore].

```

<!-- hypothetical example, as groupings don't have instance data -->
<tls-client xmlns="urn:ietf:params:xml:ns:yang:ietf-tls-client">

  <!-- which certificates will this client trust -->
  <server-auth>
    <trusted-ca-certs>deployment-specific-ca-certs</trusted-ca-certs>
    <trusted-server-certs>explicitly-trusted-client-certs</trusted-server-certs>
  </server-auth>

  <!-- how this client will authenticate itself to the server -->
  <client-auth>
    <certificate>builtin-idevid-cert</certificate>
  </client-auth>

</tls-client>

```

## 2.3. YANG Model

This YANG module has a normative references to [RFC6991] and [I-D.ietf-netconf-keystore].

```
<CODE BEGINS> file "ietf-tls-client@2017-03-13.yang"
```

```

          "A reference to a list of server certificates used by
          the TLS client to authenticate TLS server certificates.
          A server certificate is authenticated if it is an
          exact match to a configured trusted server certificate.";
      }
    }
  }

  container client-auth {
    description
      "The credentials used by the client to authenticate to
      the TLS server.";
```

```
    choice auth-type {
      description
        "The authentication type.";
      leaf certificate {
        type leafref {
          path "/ks:keystore/ks:keys/ks:key/ks:certificates"
            + "/ks:certificate/ks:name";
        }
        description
          "A certificates to be used for user authentication.";
      }
    }
  }
}

container hello-params {
  if-feature tls-client-hello-params-config;
  uses tlscom:hello-params-grouping;
  description
    "Configurable parameters for the TLS hello message.";
}

} // end tls-client-grouping
}
```

<CODE ENDS>

### 3. The TLS Server Model

The TLS server model presented in this section contains one YANG grouping, for just the TLS-level configuration omitting, for instance, configuration for which ports to open to listen for connections on.

This grouping references data nodes defined by the keystore model [I-D.ietf-netconf-keystore]. For instance, a reference to the keystore model is made to indicate which certificate a server should present.

#### 3.1. Tree Diagram

The following tree diagram presents the data model for the grouping defined in the ietf-tls-server module. Please see Section 1.2 for tree diagram notation.

```

module: ietf-tls-server
groupings:
  tls-server-grouping
    +---- certificates
    |   +---- certificate* [name]
    |   |   +---- name?   leafref
    +---- client-auth
    |   +---- trusted-ca-certs?
    |   |   -> /ks:keystore/trusted-certificates/name
    |   +---- trusted-client-certs?
    |   |   -> /ks:keystore/trusted-certificates/name
    +---- hello-params {tls-server-hello-params-config}?
    |   +---- tls-versions
    |   |   +---- tls-version*   identityref
    +---- cipher-suites
    |   +---- cipher-suite*   identityref

```

### 3.2. Example Usage

This section shows how it would appear if the `tls-server-grouping` were populated with some data. This example is consistent with the examples presented in Section 2.2 of [I-D.ietf-netconf-keystore].

```

<!-- hypothetical example, groupings don't have instance data -->

<tls-server
  xmlns="urn:ietf:params:xml:ns:yang:ietf-tls-server">
  <certificates>
    <certificate>
      <name>tls-ec-cert</name>
    </certificate>
  </certificates>
  <client-auth>
    <trusted-ca-certs>deployment-specific-ca-certs</trusted-ca-certs>
    <trusted-client-certs>explicitly-trusted-client-certs</trusted-client-certs>
  </client-auth>
</tls-server>

```

### 3.3. YANG Model

This YANG module has a normative references to [RFC6991], and [I-D.ietf-netconf-keystore].

```

<CODE ENDS>

#### 4. The TLS Common Model

The TLS common model presented in this section contains identities and groupings common to both TLS clients and TLS servers. The hello-params-grouping can be used to configure the list of TLS algorithms permitted by the TLS client or TLS server. The lists of algorithms are ordered such that, if multiple algorithms are permitted by the client, the algorithm that appears first in its list that is also permitted by the server is used for the TLS transport layer connection. The ability to restrict the the algorithms allowed is

provided in this grouping for TLS clients and TLS servers that are capable of doing so and may serve to make TLS clients and TLS servers compliant with security policies.

Features are defined for algorithms that are OPTIONAL or are not widely supported by popular implementations. Note that the list of algorithms is not exhaustive.

#### 4.1. Tree Diagram

The following tree diagram presents the data model for the grouping defined in the ietf-tls-common module. Please see Section 1.2 for tree diagram notation.

```
module: ietf-tls-common
  groupings:
    hello-params-grouping
      +----- tls-versions
      |   +----- tls-version*   identityref
      +----- cipher-suites
      |   +----- cipher-suite*   identityref
```

#### 4.2. Example Usage

This section shows how it would appear if the transport-params-grouping were populated with some data.

```
<!-- hypothetical example, as groupings don't have instance data -->
<hello-params xmlns="urn:ietf:params:xml:ns:yang:ietf-tls-common">

  <tls-versions>
    <tls-version>tls-1.2</tls-version>
  </tls-versions>
  <cipher-suites>
    <cipher-suite>ecdhe-rsa-with-3des-edc-cbc-sha</cipher-suite>
    <cipher-suite>dhe-rsa-with-aes-128-cbc-sha</cipher-suite>
    <cipher-suite>rsa-with-aes-128-cbc-sha</cipher-suite>
    <cipher-suite>rsa-with-3des-edc-cbc-sha</cipher-suite>
  </cipher-suites>

</hello-params>
```

#### 4.3. YANG Model

This YANG module has a normative references to [RFC4492], [RFC5246], [RFC5288], and [RFC5289].

```
<CODE BEGINS> file "ietf-tls-common@2017-03-13.yang"

## 5. Security Considerations

The YANG module defined in this document is designed to be accessed via YANG based management protocols, such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [RFC6536] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

- /: The entire data tree defined by this module is sensitive to write operations. For instance, the addition or removal of references to keys, certificates, trusted anchors, etc., can dramatically alter the implemented security policy. However, no NACM annotations are applied as the data SHOULD be editable by users other than a designated 'recovery session'.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

NONE

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

NONE

## 6. IANA Considerations

### 6.1. The IETF XML Registry

This document registers three URIs in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following registrations are requested:

URI: urn:ietf:params:xml:ns:yang:ietf-tls-client  
Registrant Contact: The NETCONF WG of the IETF.  
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-tls-server  
Registrant Contact: The NETCONF WG of the IETF.  
XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-tls-common  
Registrant Contact: The NETCONF WG of the IETF.  
XML: N/A, the requested URI is an XML namespace.

### 6.2. The YANG Module Names Registry

This document registers three YANG modules in the YANG Module Names registry [RFC7950]. Following the format in [RFC7950], the the following registrations are requested:

name: ietf-tls-client  
namespace: urn:ietf:params:xml:ns:yang:ietf-tls-client  
prefix: tlsc  
reference: RFC XXXX

name: ietf-tls-server  
namespace: urn:ietf:params:xml:ns:yang:ietf-tls-server  
prefix: tlss  
reference: RFC XXXX

name: ietf-tls-common  
namespace: urn:ietf:params:xml:ns:yang:ietf-tls-common  
prefix: tlss  
reference: RFC XXXX

## 7. Acknowledgements

The authors would like to thank for following for lively discussions on list and in the halls (ordered by last name): Andy Bierman, Martin Bjorklund, Benoit Claise, Mehmet Ersue, David Lamparter, Alan Luchuk, Ladislav Lhotka, Radek Krejci, Tom Petch, Juergen Schoenwaelder, Phil Shafer, Sean Turner, and Bert Wijnen.

## Appendix A. Change Log

## A.1. server-model-09 to 00

- o This draft was split out from draft-ietf-netconf-server-model-09.
- o Noted that '0.0.0.0' and ':::' might have special meanings.

## A.2. 00 to 01

- o Renamed "keychain" to "keystore".

## A.3. 01 to 02

- o Removed the groupings containing transport-level configuration. Now modules contain only the transport-independent groupings.
- o Filled in previously incomplete 'ietf-tls-client' module.
- o Added cipher suites for various algorithms into new 'ietf-tls-common' module.

## Appendix B. Open Issues

Please see: <https://github.com/netconf-wg/tls-client-server/issues>.
