A YANG Data Model for Configuration Scheduling
draft-liu-netmod-yang-schedule-05

Abstract

This document describes a data model for configuration scheduling.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 2, 2018.

Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

Table of Contents

1. Introduction

This document introduces a YANG [RFC6020] [RFC7950] data model for configuration scheduling. This model can be used together with other YANG data models to specify a schedule applied on a configuration data node, so that the configuration data can take effect according to the schedule. Such a configuration schedule can be one-time or recurring, with its properties persistently saved in the datastores of the management system server.

The mechanism described in this document is designed to complement the one described in [RFC7758], which defines a capability extension to NETCONF to allow time-triggered RPCs. Such RPCs can be executed at a future time moment, but cannot be repeated and is not saved in the persistent datastores.

1.1. Terminology

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14, [RFC2119].

The following terms are defined in [RFC7950] and are not redefined here:

- augment
- data model
- data node

2. Motivation

Some applications benefit from resource scheduling to allow operators to plan ahead of time. Traffic engineering is one of such examples [RFC7399]. When configuration and state models are designed for such applications, it has been considered that certain data objects need to be configured according to predefined schedules. In other situations, operators need to deconfigure certain data objects at predefined schedules for the purposes such as maintenance. These data objects are interpreted and implemented by the applicable applications.

Delay/Disruption Tolerant Networking (DTN) is another example for which the scheduled configuration can be used, where a long-lived, reliable, low-latency sequenced data delivery session is unsustainable. Section 4.3 of [I-D.birrane-dtn-ama] describes the Autonomous Parameterized Control. Time-based event is one of the two types of triggers in such a system.

3. Configuration Scheduling YANG Data Model Overview

This document defines a YANG data model that specifies configuration schedules for other YANG data models. For each targeted configuration data object or a group of configuration data objects, an entry is specified along with requested schedules using this configuration schedule model. The application implementing the targeted schema nodes implements the configuration schedules, configuring or deconfiguring the specified objects according to the specified schedules. The model schema of the targeted application does not need changes, so the data model described in this document can be used for any data model. The configuration scheduling YANG data model has the following structure:

```
module: ietf-schedule
    +--rw configuration-schedules
       +--rw target* [object]
          +--rw object       yang:xpath1.0
          +--rw schedules
          |  +--rw schedule* [schedule-id]
          |     +--rw schedule-id            uint32
          |     +--rw inclusive-exclusive?   enumeration
          |     +--rw start?                 yang:date-and-time
          |     +--rw schedule-duration?     string
          |     +--rw repeat-interval?       string
          |     +--rw operation?             operation
          |     +--rw data-value?            <anydata>
          +--ro state
          |  +--ro future-executions
          |     +--ro execution* [start]
          |        +--ro start        yang:date-and-time
          |        +--ro duration?    string
          |        +--ro operation?   operation
          +---n execution
             +---- operation    operation
             +---- datetime?    yang:date-and-time
             +---- results?     <anydata>
```

4. Usage Example

The following model defines a list of TE (Traffic Engineering) links which can be configured with specified schedules:

```
module: example
   +--rw te-links
      +--rw te-link* [id]
         +--rw id         string
         +--rw enabled?   boolean
```

The following configuration requests that

- link-1 is configured weekly for five one-day periods, starting from 2016-09-12T23:20:50.52Z.
- link-2 is deconfigured for two hours, starting from 2016-09-15T01:00:00.00Z.

```
<configuration-schedules>
  <target xmlns:ex="urn:example">
    <object>/ex:te-links</object>
    <schedules>
      <schedule>
        <schedule-id>11<schedule-id>
        <start>2016-09-12T23:20:50.52Z</start>
        <schedule-duration>P1D</schedule-duration>
        <repeat-interval>R5/P1W</repeat-interval>
        <operation>configure</operation>
        <data-value>
          <te-link>
            <id>link-1</id>
            <enabled>true</enabled>
          </te-link>
        </data-value>
      </schedule>
    </schedules>
  </target>
  <target xmlns:ex="urn:example">
    <object>/ex:te-links</object>
    <schedules>
      <schedule>
        <schedule-id>12<schedule-id>
        <inclusive-exclusive>exclusive</inclusive-exclusive>
        <start>2016-09-15T01:00:00.00Z</start>
        <schedule-duration>P2H</schedule-duration>
        <operation>configure</operation>
        <data-value>
          <te-link>
            <id>link-2</id>
            <enabled>true</enabled>
          </te-link>
        </data-value>
      </schedule>
    </schedules>
  </target>
</configuration-schedules>
```

The following configuration requests that

- link-1 is enabled weekly for five one-day periods, starting from 2016-09-12T23:20:50.52Z.

- link-2 is not enabled for two hours, starting from 2016-09-15T01:00:00.00Z.

```
<configuration-schedules>
  <target xmlns:ex="urn:example">
    <object>/ex:te-links/ex:te-link[ex:link-id='link-1']/ex:enabled
    </object>
    <schedules>
      <schedule>
        <schedule-id>11<schedule-id>
        <start>2016-09-12T23:20:50.52Z</start>
        <schedule-duration>P1D</schedule-duration>
        <repeat-interval>R5/P1W</repeat-interval>
        <operation>set</operation>
        <data-value>true</data-value>
      </schedule>
    </schedules>
  </target>
  <target xmlns:ex="urn:example">
    <object>/ex:te-links/ex:te-link[ex:link-id='link-2']/ex:enabled
    </object>
    <schedules>
      <schedule>
        <schedule-id>12<schedule-id>
        <inclusive-exclusive>exclusive</inclusive-exclusive>
        <start>2016-09-15T01:00:00.00Z</start>
        <schedule-duration>P2H</schedule-duration>
        <operation>set</operation>
        <data-value>true</data-value>
      </schedule>
    </schedules>
  </target>
</configuration-schedules>
```

5. Relations to Datastores

NETCONF defines configuration datastores and operations that can be used to access these datastores. The configuration data encoded according to this data model is persistently saved in the proper datastores in the same way as other data model, such as ietf-interfaces.

5.1. Validation

When configuration data based on this model is received, the server MUST perform syntax validations on the received data nodes, and examine the requested schedules. The server does not validate whether requested target configuration data can be applied to the

target configuration objects, until the actual scheduled time arrives.

At each scheduled time moment, the server applies the requested target configuration data to the target configuration objects. The server MUST perform the validations on the target configuration data along with the current target configuration objects in the proper datastore.

5.2. Schedules Expansion and Operational States

The server SHOULD expand these schedules and expose them to the client as operational states.

5.3. Server Executions at Scheduled Moments

At each scheduled time moment, the server applies the requested target configuration data to the target configuration objects, as if an RPC request is newly received. Whether such a time-triggered configuration is successfully applied depends on the configuration data of the target object and requested configuration data. The results of such executions are sent to the client through notifications. The notification management mechanism described in [I-D.ietf-netconf-yang-push] and [I-D.ietf-netconf-subscribed-notifications] can be used to enable, disable, subscribe, filter, and replay the notifications.

5.4. Interactions with Locks

The rules of datastore lock specified by NETCONF [RFC6241] are checked when the schedule configuration data is received and when the target configuration data is applied.

5.5. Interactions with Authorization Mechanism

If the server implements any authorization mechanism, the authorization rules MUST be checked against this data model schema when the schedule configuration data is received. At each scheduled time moment, the authorization rules MUST be checked against the target objects by using the target configuration data. To check the authorization rules, the server uses the same client credential learned when the initial configuration data was received.

6. Synchronization Aspects

The scheduling mechanisms described in this document assume that servers have access to the wall-clock time. Thus, servers are required to acquire the time-of-day from an external time source, for

example using the Network Time Protocol [RFC5905], or the Precision Time Protocol [IEEE1588].

It is assumed that the client and servers rely on a common time source, so as to guarantee that schedules are defined with respect to a common reference. In order to avoid the potential ambiguity of different time zones and daylight saving time, it is recommended to define all schedules in the UTC time zone, using the suffix 'Z'. For example, the time 2016-09-12T23:20:50.52Z, is specified with respect to the UTC time zone.

7. Configuration Scheduling YANG Module

```
<CODE BEGINS> file "ietf-schedule@2018-02-26.yang"

8. IANA Considerations

RFC Ed.: In this section, replace all occurrences of 'XXXX' with the actual RFC number (and remove this note).

This document registers the following namespace URI in the IETF XML registry [RFC3688]:

```
---------------------------------------------------------------------
URI: urn:ietf:params:xml:ns:yang:ietf-schedule
Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.
---------------------------------------------------------------------
```

This document registers the following YANG module in the YANG Module Names registry [RFC6020]:

```
---------------------------------------------------------------------
name:         ietf-schedule
namespace:    urn:ietf:params:xml:ns:yang:ietf-schedule
prefix:       l3te
reference:    RFC XXXX
---------------------------------------------------------------------
```

9. Security Considerations

The configuration, state, action and notification data defined in this document are designed to be accessed via the NETCONF protocol [RFC6241]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The NETCONF access control model [RFC6536] provides the means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and contents.

The functionality defined in this memo can potentially allow network reconnaissance; by gathering information about schedules an attacker can learn about the network policy, its temporal behavior, and future events.

The schedule YANG model defines schedules that are writable, creatable, and deletable. Therefore, this model may be considered sensitive or vulnerable in some network environments. An attacker may maliciously configure a schedule in a way that disrupts the normal behavior of the network. Furthermore, an attacker may attempt to maliciously set a schedule or a set of schedules in a way that amplifies an attack, or schedules an attack to a particularly sensitive time instant.

The use of configuration scheduling implicitly assumes that there is an underlying synchronization or time distribution mechanism. Therefore, an attack on the synchronization mechanism may compromise the configuration scheduling. The security considerations of time protocols are discussed further in [RFC7384].
