DNS/DNSSEC/DNS Privacy

IETF 98 Hackathon
Chicago

Projects

- DNS Privacy
 - Monitoring plug-in for DNS-over-TLS servers
 - Performance of DNS-over-TLS servers
 - Implementation of DNS Padding
 - Implementation of new forwarder
- DNSSEC: Zero configuration DNSSEC in getdns

DNS-over-TLS Monitoring plug-in

- Based on Nagios API - tests for:
 - DNS response on port 853 over TLS
 - Server authenticated (hostname/pinset)
 - Checks if certificate is about to expire
 - FUTURE - QNAME MIN, Keepalive

RFC 7858 (DNS-over-TLS), RFC 7766 (DNS-over-TCP), RFC7815 (QNAME-MIN), RFC7858 (Keepalive), draft-ietf-dpdrive-dtls-and-tls-profiles

DNS-over-TLS Monitoring plug-in

CRITICAL
16:05

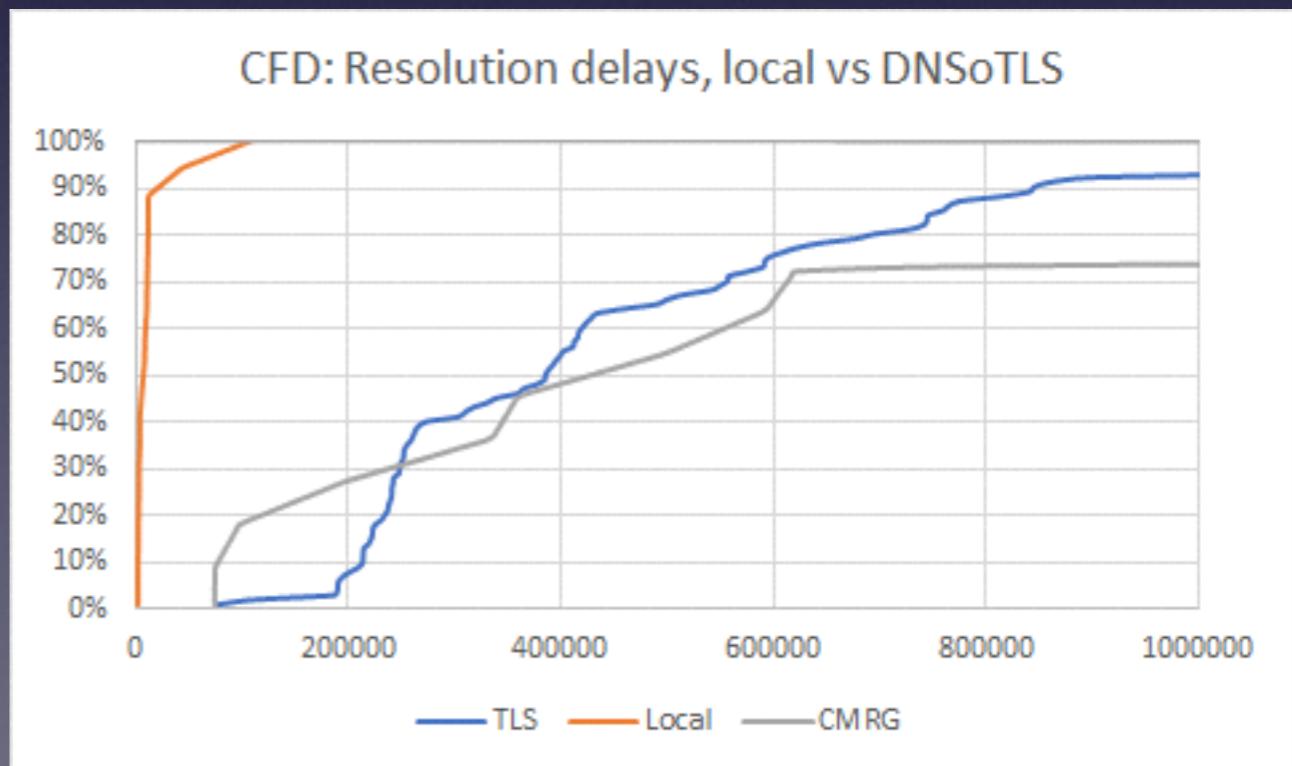

surfnet-2-v4: dns-tls

GETDNS CRITICAL - Certificate will expire in 14 days

!

Performance of DNS-over-TLS servers

- Implementation of test script comparing local resolver to existing DNS-over-TLS servers
- “Interesting” results
- Basis for much more in depth investigation

patches
submitted to
Knot Auth and
Knot Resolver

dkg

DNS Padding

- draft-mayrhofer-ddrive-padding-profile =>
Default policy to pad queries to mult of 128 octets, responses to mult of 468
- Implementation (patches submitted)
 - libknot - new API with ‘sensible’ default padding policy
 - kdig uses this by default for TLS queries
 - kresd - makes use of libknot API
 - Plan is for getdns + Unbound

kresd as a DNS-over-TLS forwarder

- Client side DNS-over-TSL - Already have Stubby, Unbound
- kresd implementation in progress
 - basic implementation + config done
 - but... still debugging

Zero configuration DNSSEC in getdns

- Root KSK is rolling! New key is public, roll will happen Oct 2017
- Some DNS implementations use static config of root trust anchor and rely on RFC5011 but...
- getdns would like to implement purely dynamic key management (RFC7958)
