

# ROLIE

Stephen Banghart

Dave Waltermire

# -06 changes

- Added the `rolie:property` element (Issue #51)
- Set Service and Category document URL template requirements (Issue #53/54)
- Changed to standards track (IETF 97 Decision)
- Fixed references (Issue #49)
- Fixed XML snippets in examples (Issue #50/48)

# rolie:property Element (#51)

- Properties must be registered via IANA table
- Arbitrary local elements are still allowed.

```
#rnc schema
rolieProperty =
  element rolie:property {
    app:appCommonAttributes,
    attribute name { atom:atomURI },
    attribute value { text }
    empty
```

# Service and Category Document Location (#53/54)

- Service Document URL Template:  
"https://{host:port}/rolie/servicedocument"
- Category Document URL Template:  
"https://{host:port}/rolie/categorydocument"
- Dereferencing this URL MAY result in a 3xx redirect to the actual document location.

# Changed to Standards track

- The specification was changed from experimental to standards track following the IETF 97 MILE meeting.

# Fixed References (#49) & Fixed Examples (#50/#48)

- Reviewed and corrected references to remove unused references and re-sort into informative and normative groupings.
- Reviewed and correct XML snippets and example text to reflect recent specification changes and ensure validity.

# Way Forward - ROLIE

- All major work on the document is complete and ready for review
- WGLC needs to be restarted in order for recent changes to be reviewed by the WG.

# Way Forward - Extensions

- The CSIRT (MILE) and Software Descriptor (SACM) ROLIE extensions need review from people knowledgeable in these areas.
- Additional extension drafts to be authored: Checklists, Vulnerabilities, etc.
