Oscar Gonzalez De Dios (Telefonica)

Contributors:

Sergio Belotti (Nokia)

Dieter Beller (Nokia)

Carlo Perocchio (Ericsson)

Italo Busi (Huawei Technologies)

Summary of Changes

- Allowed multiple instances of inter-layer-lock-id on a termination point.
- Added missing TTPs to underlay tunnel.
- Added name, admin-status, oper-status to LTP and TTP.
- Handling of connectivity-matrix labels for regen, splitting and merging.
- Type and grouping sharing with TE tunnel model.
- Improved TE generic bandwidth modeling.
- Addressed YANG doctor's review comments.
- Updated to NMDA style with “-state” module.

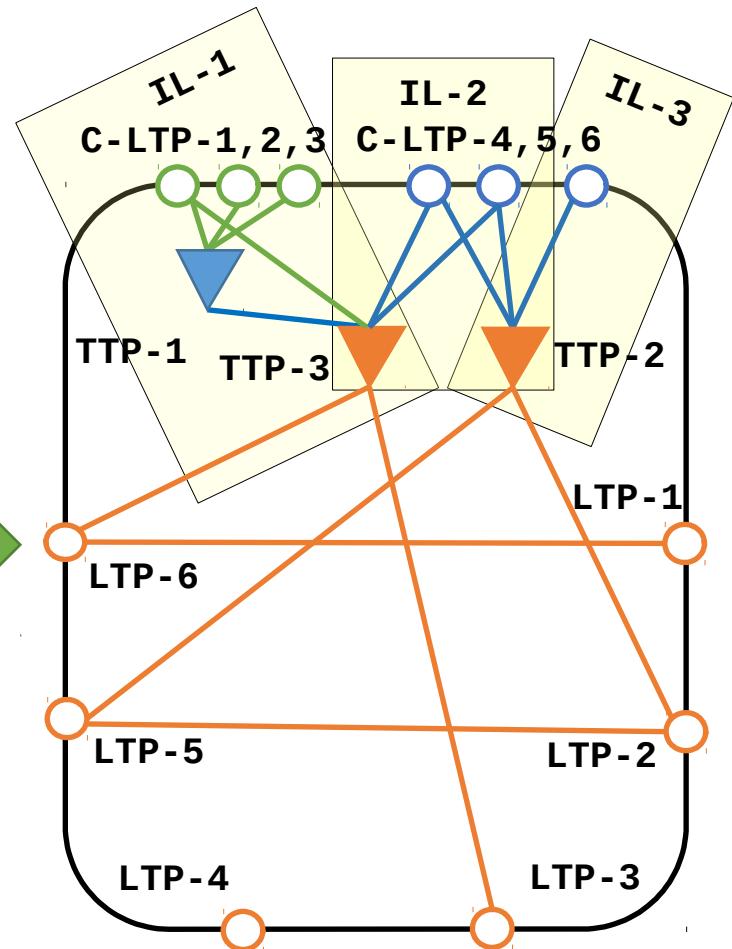

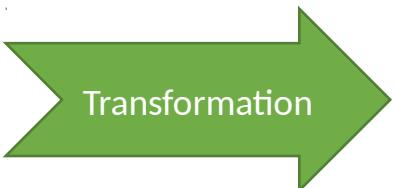

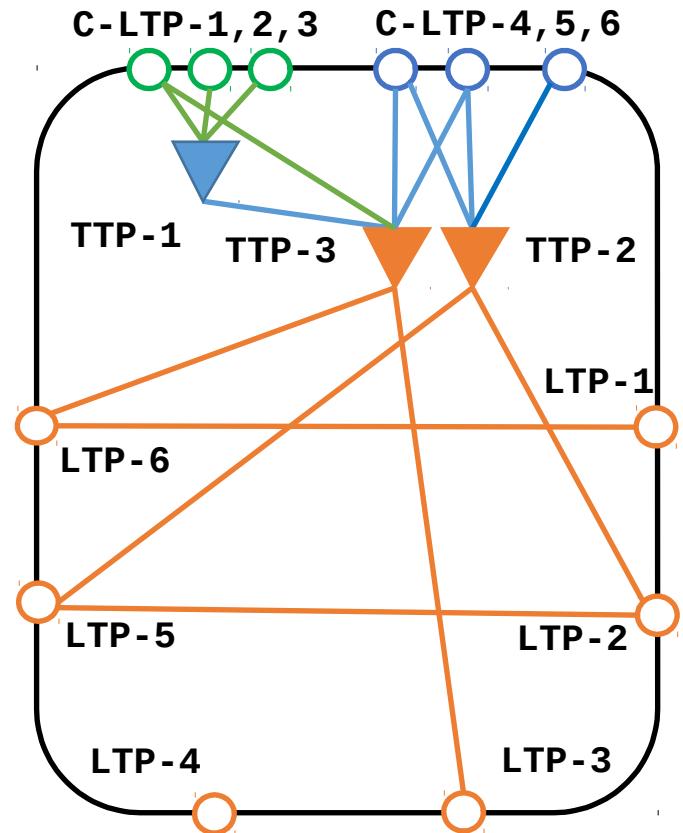

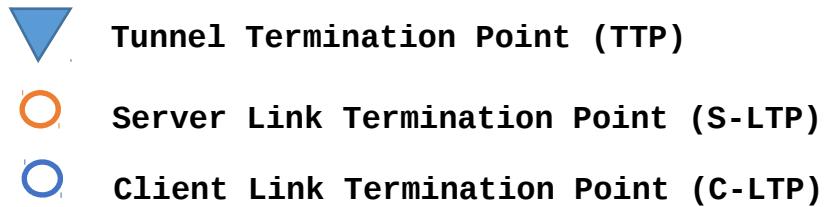

Inter Layer Lock ID

- Allow multiple instances of inter-layer-lock-id on a tunnel termination point or a link termination point.
- Changed from leaf to leaf-list

```
augment /nw:networks/nw:network/nw:node:  
  +-rw te-node-id?    te-types:te-node-id  
  +-rw te!  
  +-rw tunnel-termination-point* [tunnel-tp-id]  
    +-rw tunnel-tp-id          binary  
    +-rw admin-status?        te-types:te-admin-status  
    +-rw name?                string  
    +-rw switching-capability? identityref  
    +-rw encoding?            identityref  
  +-rw inter-layer-lock-id? uint32  
  +-rw inter-layer-lock-id* uint32  
  +-rw protection-type?     identityref  
  
augment /nw:networks/nw:network/nw:node/nt:termination-point:  
  +-rw te-tp-id?    te-types:te-tp-id  
  +-rw te!  
  +-rw admin-status?        te-types:te-admin-status  
  +-rw name?                string  
  +-rw inter-layer-lock-id? uint32  
  +-rw inter-layer-lock-id* uint32
```

Multi-layer Topology

- Inter-layer lock IDs “IL-1” and “IL-2” are set on TTP-3

Added name, admin-status, oper-status to LTP and TTP.

- Received feedback from implementers, asking a few attributes on LTP and TTP for convenience.

```
augment /nw:networks/nw:network/nw:node/nt:termination-point:  
  +-rw te-tp-id?    te-types:te-tp-id  
  +-rw te!  
    +-rw admin-status?  
    +-rw name?  
    ...  
    +-ro oper-status?  
  
augment /nw:networks/nw:network/nw:node:  
  +-rw te-node-id?    te-types:te-node-id  
  +-rw te!  
    +-rw tunnel-termination-point* [tunnel-tp-id]  
      +-rw tunnel-tp-id          binary  
      +-rw admin-status?  
      +-rw name?  
      +-rw switching-capability?  
      ...  
      +-ro oper-status?
```

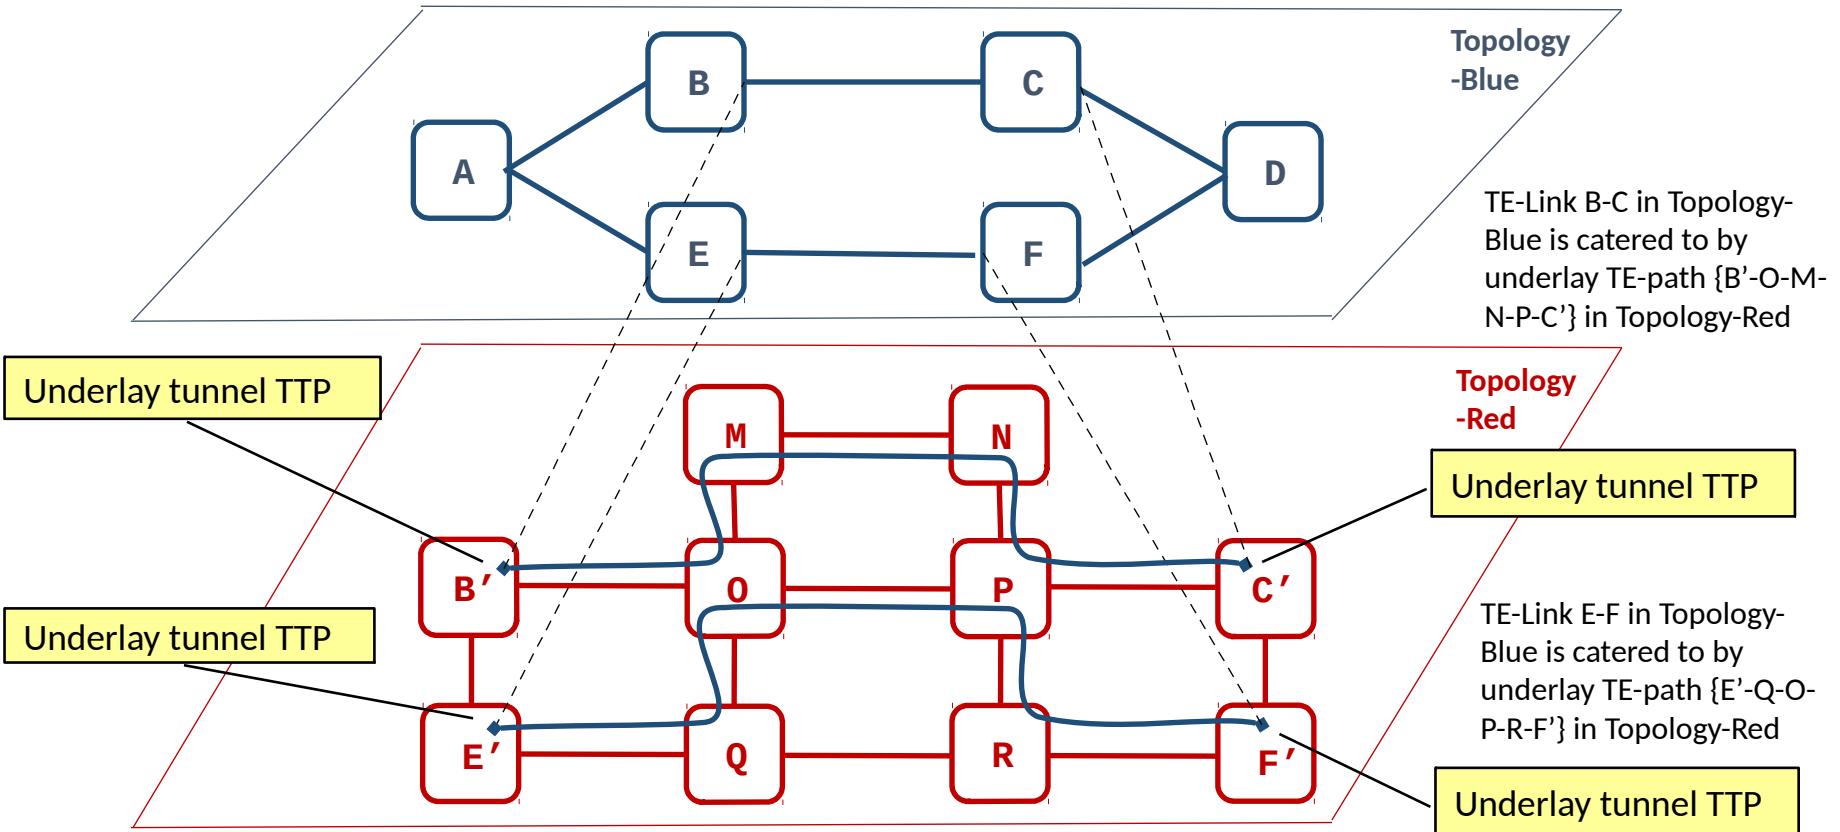

te-types:te-admin-status
String

te-types:te-oper-status

te-types:te-admin-status
string
identityref

te-types:te-oper-status

Underlay Tunnel TTP

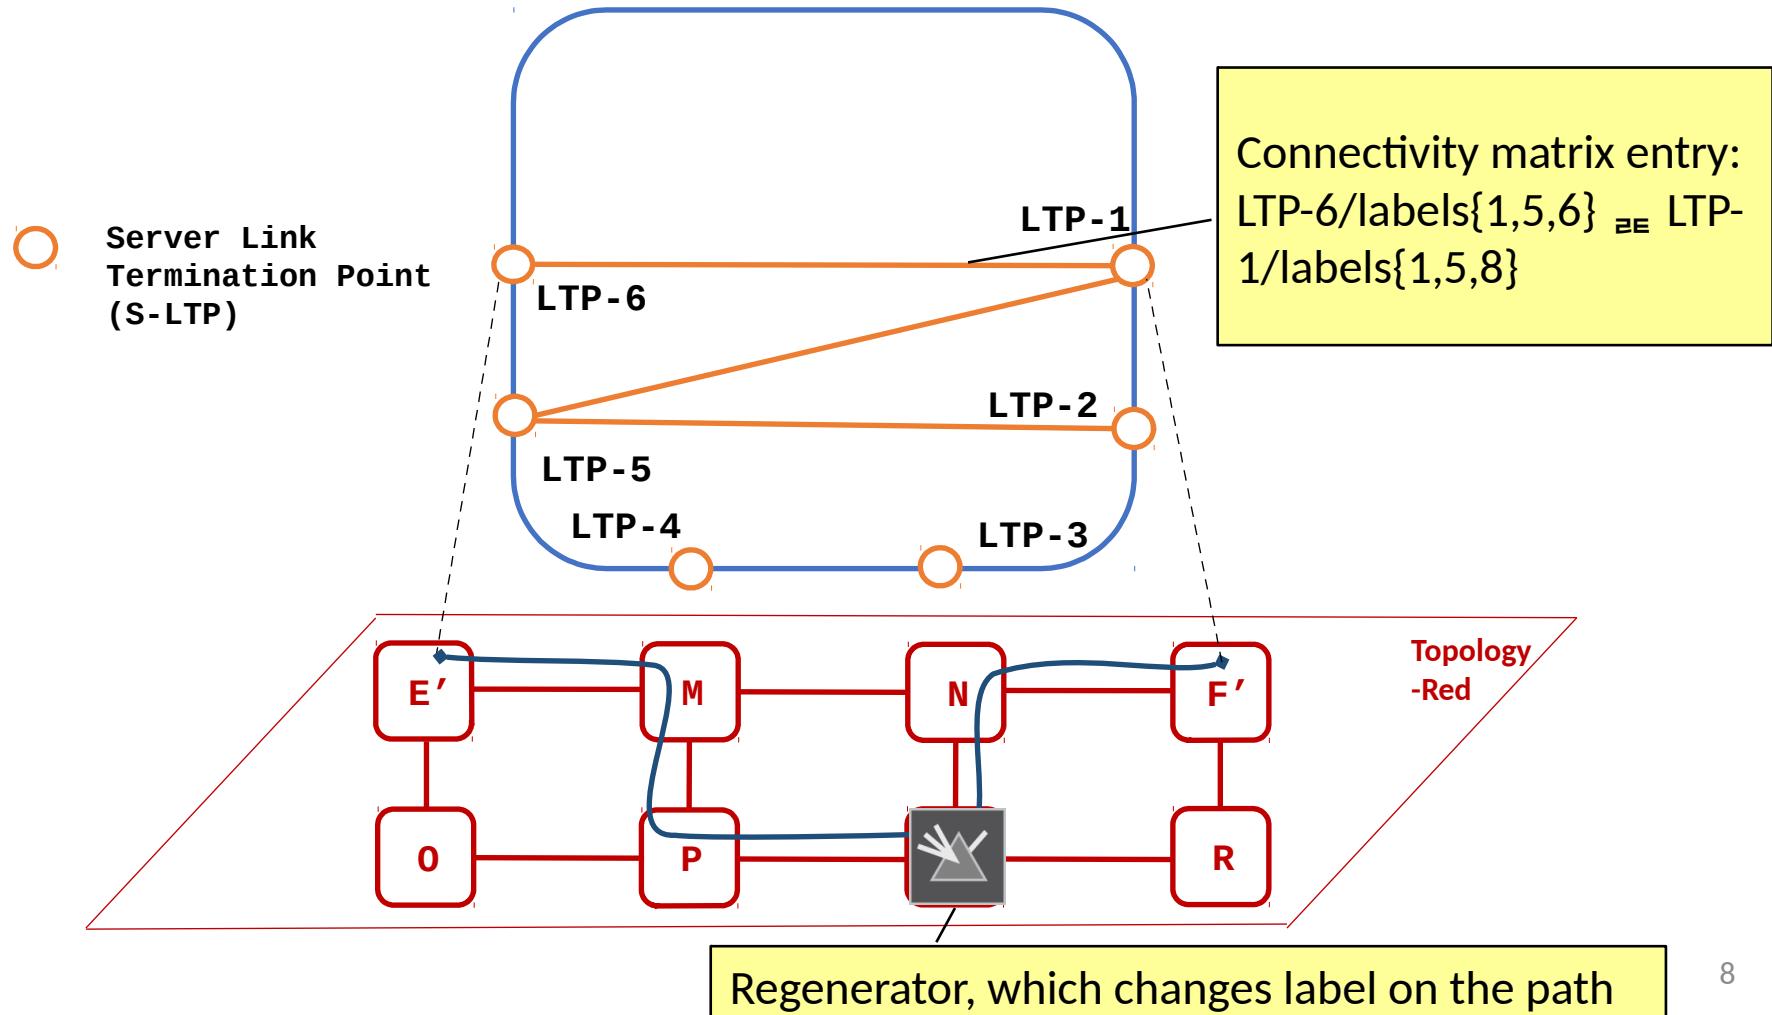

Added TTPs to Underlay Tunnel

- Allowed to specify tunnel termination points for under tunnels

```
augment /nw:networks/nw:network/nw:node:  
  +-rw te-node-id?    te-types:te-node-id  
  +-rw te!  
    +-rw te-node-attributes  
    |  +-rw connectivity-matrices  
    |  |  +-rw connectivity-matrix* [id]  
    |  |  +-rw underlay {te-topology-hierarchy}?  
    |  |  |  +-rw tunnel-termination-points  
    |  |  |  |  +-rw source?      binary  
    |  |  |  |  +-rw destination?  binary  
  
  +-rw tunnel-termination-point* [tunnel-tp-id]  
  +-rw local-link-connectivities  
    |  +-rw is-allowed?          boolean  
    |  +-rw underlay {te-topology-hierarchy}?  
    |  |  +-rw protection-type?   identityref  
    |  |  +-rw tunnel-termination-points  
    |  |  |  +-rw source?      binary  
    |  |  |  +-rw destination?  binary  
  
augment /nw:networks/nw:network/nt:link:  
  +-rw te!  
    +-rw te-link-attributes  
    |  +-rw underlay {te-topology-hierarchy}?  
    |  |  +-rw protection-type?   identityref  
    |  |  +-rw tunnel-termination-points  
    |  |  |  +-rw source?      binary  
    |  |  |  +-rw destination?  binary
```

Handling of Connectivity-matrix Label

- Label sets on two termination points may be different ($\{1,5, 6\} \neq \{1, 5, 8\}$).

Handling of Connectivity-matrix Label

- Moved label-restriction from the connectivity matrix entry to the termination points.

```
augment /nw:networks/nw:network/nw:node:  
  +-rw te-node-id?    te-types:te-node-id  
  +-rw te!  
    +-rw te-node-template*          leafref {template}?  
    +-rw te-node-attributes  
      +-rw admin-status?          te-types:te-admin-status  
      +-rw connectivity-matrices  
        +-rw connectivity-matrix* [id]  
          +-rw id                  uint32  
          +-rw from  
            +-rw tp-ref?            leafref  
            +-rw label-restriction* [inclusive-exclusive label-start]  
              +-rw inclusive-exclusive  enumeration  
              +-rw label-start          rt-types:generalized-label  
              +-rw label-end?          rt-types:generalized-label  
              +-rw range-bitmap?       binary  
          +-rw to  
            +-rw tp-ref?            leafref  
            +-rw label-restriction* [inclusive-exclusive label-start]  
              +-rw inclusive-exclusive  enumeration  
              +-rw label-start          rt-types:generalized-label  
              +-rw label-end?          rt-types:generalized-label  
              +-rw range-bitmap?       binary  
          +-rw is-allowed?  
          +-rw label-restriction* [inclusive-exclusive label-start]  
            +-rw inclusive-exclusive  enumeration  
            +-rw label-start          rt-types:generalized-label  
            +-rw label-end?          rt-types:generalized-label  
            +-rw range-bitmap?       binary
```

Type and Grouping Sharing with TE Tunnel Model

- Defined some shared types and groupings in ietf-te-types.yang to share between TE topology model and TE tunnel model.
- The followings groupings have been used in recent topology model for underlay tunnel modeling:
 - path-constraints
 - optimizations
 - computed-path-properties

Improved TE Generic Bandwidth Modeling

- Defined as a grouping with a choice for different technologies to use different cases.
- A few well-known technology cases are defined, while allowing future extensions.

```
+--rw te-bandwidth
  +-rw (technology)?
    +---:(psc)
      |  +-rw psc?          rt-types:bandwidth-ieee-float32
    +---:(otn)
      |  +-rw otn* [rate-type]
      |    +-rw rate-type   identityref
      |    +-rw counter?    uint16
    +---:(lsc)
      |  +-rw wdm* [spectrum slot]
      |    +-rw spectrum    identityref
      |    +-rw slot        int16
      |    +-rw width?      uint16
    +---:(generic)
      +-rw generic?      te-bandwidth
```

Addressed YANG Doctor's Review Comments

- Removed a few “presence” statements on the “underlay” containers, and used the “enable/disable” leaves instead.
- Fixed several terminology inconsistencies in the draft.
- Removed some unnecessary groupings.
- Changed the model structure to NMDA compatible with a companion “-state” module. (More on the next slide)

NMDA Guidelines

- NMDA guidelines were published at

<https://tools.ietf.org/html/draft-dsdt-nmda-guidelines-01>

- Models that require immediate "in use" and "system created" information SHOULD be structured for NMDA.
- A non-NMDA version of these models SHOULD exist, either an existing model or a model created either by hand or with suitable tools that mirror the current modeling strategies.

```
module example-thermostat {  
    namespace  
        "tag:ietf:example:thermostat";  
    prefix "thermo";  
    container thermostat {  
        leaf high-temperature {  
            description  
                "High temperature threshold";  
            type int;  
        }  
        leaf low-temperature {  
            description  
                "Low temperature threshold";  
            type int;  
        }  
        leaf current-temperature {  
            description  
                "Current temperature reading";  
            type int;  
            config false;  
        }  
    }  
}
```

```
module example-thermostat-state {  
    namespace  
        "tag:ietf:example:thermostat-state";  
    prefix "thermo-state";  
    container thermostat {  
        config false;  
        leaf high-temperature {  
            description  
                "High temperature threshold";  
            type int;  
        }  
        leaf low-temperature {  
            description  
                "Low temperature threshold";  
            type int;  
        }  
        leaf current-temperature {  
            description  
                "Current temperature reading";  
            type int;  
        }  
    }  
}
```

TE Topology Model Style Considerations

- Maintain sufficient modeling capabilities, including “config” and “state” information.
 - To move to NMDA, the “-state” module is needed.
 - To build the “-state” module, I2RS base topology model needs to be updated first.
- Be feature-rich, clear, efficient, and user-friendly.
- Progress this document without delay.
- Minimal impacts to implementations.
- Implementable now, before NMDA protocol updates.
- Have a migration path to move to NMDA structure.

Updated to NMDA with a “-state” Module

- I2RS topology model has agreed to update to NMDA with a “-state” module.
- TE topology model has been updated to NMDA with a “-state” module.
 - Tried to share groupings between the NMDA module and the “-state” module.
 - Any YANG statement with name space prefix, e.g. XPath, cannot be shared.
 - YANG grouping does not allow parameters, so that many groupings cannot be shared between the two modules, without re-structuring.
 - After the restructuring, the sizes of YANG modules are:
 - Before NMDA: ~1950 lines
 - NMDA: ~1940 lines
 - “-state” module: ~300 lines

Updated to NMDA with a “-state” Module

```
module: ietf-network
++-rw networks
  +-rw network* [network-id]
    | +-rw tet:provider-id?      te-types:te-global-id
    | +-rw tet:client-id?       te-types:te-global-id
    | +-rw tet:te-topology-id?   te-types:te-topology-id
    | +-rw tet:te!
      +-rw tet:preference?          uint8

    | +-rw node* [node-id]
      | +-rw node-id                  node-id
      | +-rw tet:te-node-id?        te-types:te-node-id
      | +-rw tet:te!
        +--rw tet:config
        | +--rw tet:te-node-attributes
        +--ro tet:state
        | +--ro tet:te-node-attributes
        +-rw tet:te-node-attributes

    | +-rw lnk:termination-point* [tp-id]
      | +-rw lnk:tp-id                  tp-id
      | +-rw tet:te-tp-id?            te-types:te-tp-id
      | +-rw tet:te!
        +--rw tet:config
        | +--rw tet:admin-status?      te-types:te-admin-status
        +--ro tet:state
        | +--ro tet:admin-status?      te-types:te-admin-status
        +-rw tet:admin-status?        te-types:te-admin-status
  +-rw lnk:link* [link-id]
    | +-rw lnk:source
    | +-rw lnk:destination
    | +-rw tet:te!
    | +-rw tet:te!
      +--rw tet:config
      | +--rw tet:te-link-attributes
      +--ro tet:state
      | +--ro tet:te-link-attributes
      +-rw tet:te-link-attributes
```

Next Steps

- Ready for WG last call

Yang Data Model for Layer 3 TE Topologies

draft-liu-teas-yang-l3-te-topo-04

Xufeng Liu (Jabil)

Vishnu Pavan Beeram (Juniper Networks)

Igor Bryskin (Huawei Technologies)

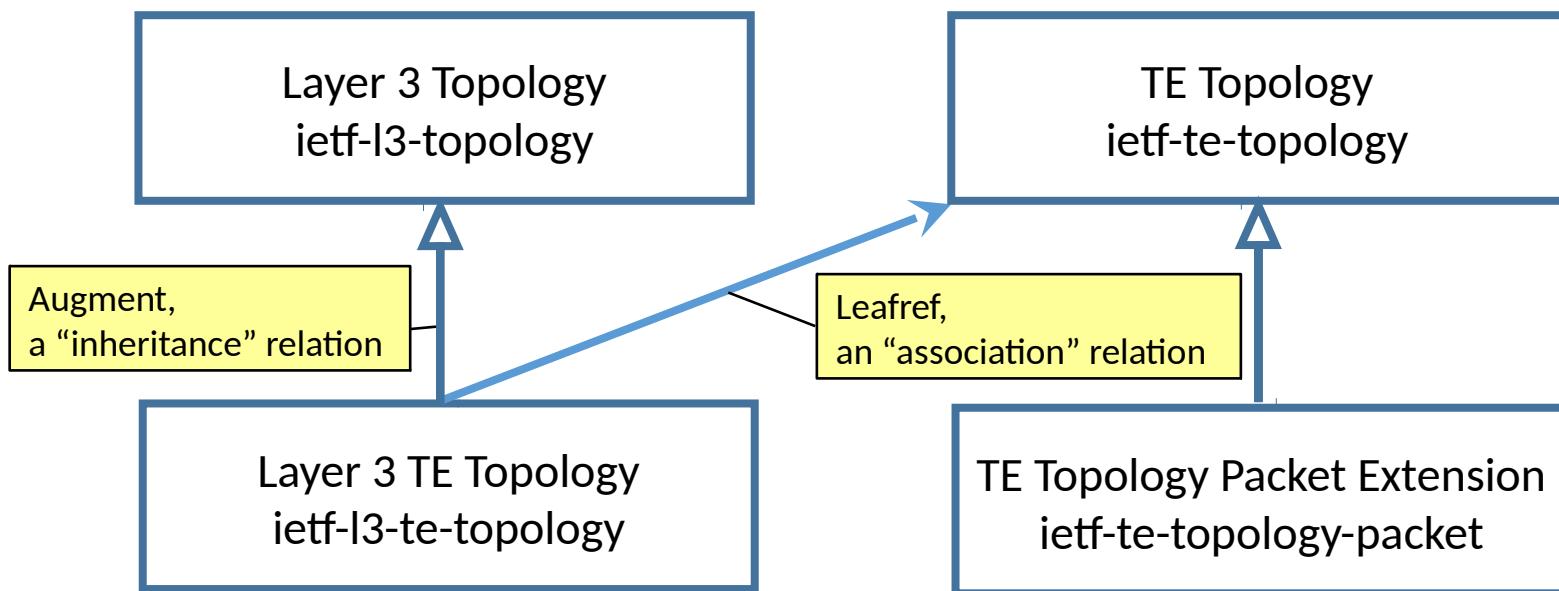

Tarek Saad (Cisco)

Himanshu Shah (Ciena)

Oscar Gonzalez De Dios (Telefonica)

Augmentation Hierarchy

- L3 TE Topology augments L3 Topology and references TE Topology.
- Packet extension module augments ietf-te-topology.

Model Reorganizations

- Modules ietf-te-topology-packet and ietf-l3-te-topology have been updated to NMDA with a “-state” module.
- Grouping sharing does not cause problems, because these two modules do not use XPath statements in groupings.
- The size comparison of ietf-te-topology-packet:
 - Before NMDA: 285 lines
 - NMDA: 244 lines
 - “-state” module: 207 lines
- The size comparison of ietf-l3-te-topology:
 - Before NMDA: 144 lines
 - NMDA: 144 lines
 - “-state” module: 74 lines

Next Steps

- Request further review.
- Ask for WG adoption.

Yang Data Model for SR and SR TE Topologies

draft-liu-teas-yang-sr-te-topo-03

Xufeng Liu (Jabil)

Vishnu Pavan Beeram (Juniper Networks)

Igor Bryskin (Huawei Technologies)

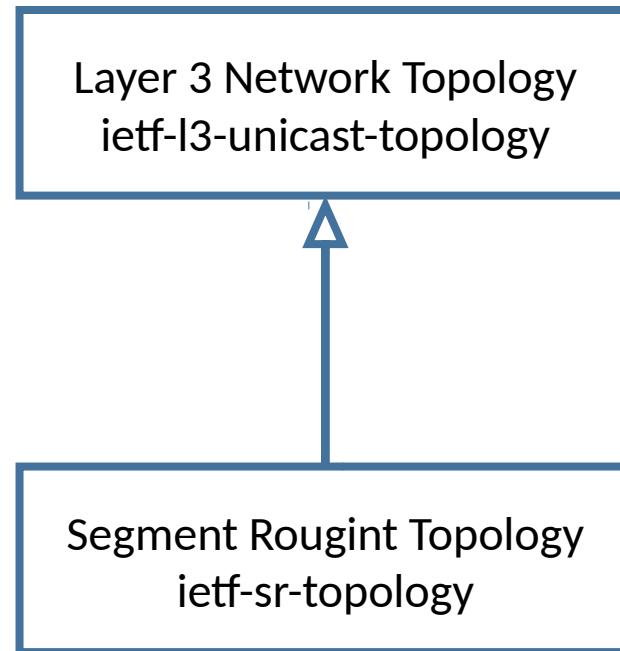

Tarek Saad (Cisco)

Himanshu Shah (Ciena)

Stephane Litkowski (Orange)

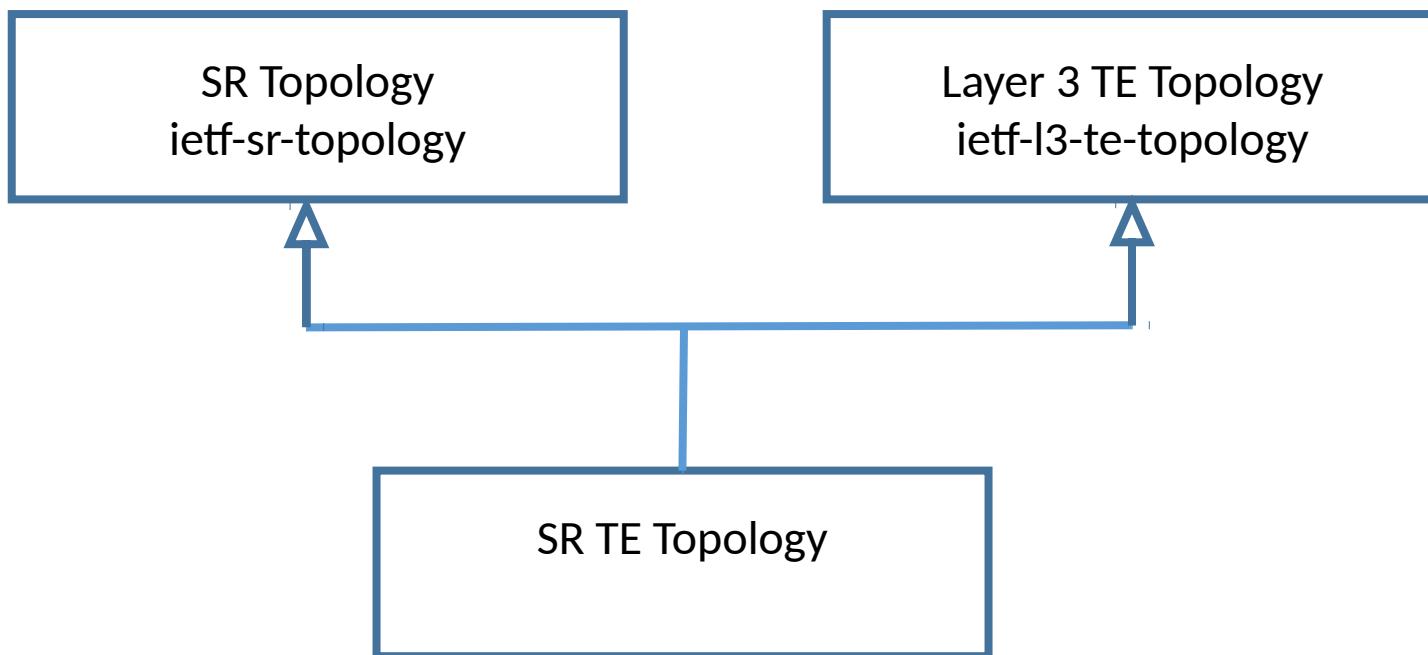

SR (Segment Routing) Topology

- Augment layer 3 network topology model

SR (Segment Routing) TE Topology

- Multiple inheritance:
 - Is both SR topology and layer 3 TE topology model.
 - Uses multiple network types: “l3-te” and “sr”.

Model Reorganizations

- Module ietf-sr-topology has been updated to NMDA with a “-state” module.
- Grouping sharing does not cause problems, because this module does not use Xpath statements in groupings.
- The size comparison of ietf-sr-topology:
 - Before NMDA: 231 lines
 - NMDA: 211 lines
 - “-state” module: 94 lines

Next Steps

- Request further review.
- Ask for WG adoption.
