

# **ROLL Interim Meeting**

2015-02-10  
slide set version 3

# Note Well

Any submission to the IETF intended by the Contributor for publication as all or part of an IETF Internet-Draft or RFC and any statement made within the context of an IETF activity is considered an "IETF Contribution". Such statements include oral statements in IETF sessions, as well as written and electronic communications made at any time or place, which are addressed to:

- The IETF plenary session
- The IESG, or any member thereof on behalf of the IESG
- Any IETF mailing list, including the IETF list itself, any working group or design team list, or any other list functioning under IETF auspices
- Any IETF working group or portion thereof
- Any Birds of a Feather (BOF) session
- The IAB or any member thereof on behalf of the IAB
- The RFC Editor or the Internet-Drafts function

All IETF Contributions are subject to the rules of [RFC 5378](#) and [RFC 3979](#) (updated by [RFC 4879](#)).

Statements made outside of an IETF session, mailing list or other function, that are clearly not intended to be input to an IETF activity, group or function, are not IETF Contributions in the context of this notice. Please consult [RFC 5378](#) and [RFC 3979](#) for details.

A participant in any IETF activity is deemed to accept all IETF rules of process, as documented in Best Current Practices RFCs and IESG Statements.

A participant in any IETF activity acknowledges that written, audio and video records of meetings may be made and may be available to the public.

# Material

Agenda: <http://www.ietf.org/proceedings/interim/2015/02/10/roll/agenda/agenda-interim-2015-roll-1>

Slides:

Presenter: Ralph Droms

# Agenda for meeting

1. Agenda bashing
2. Goals and desired outcomes for this meeting
3. Cover origin of problem: how did we get here
  - a. 6tisch requirements for minimal
  - b. 6man review of flow label
  - c. 6lo review of NHC
  - d. publication of dispatch header solution
4. Architectural deep dive of proposals on the table
- 5.

# Goal:

- Arrive at consensus on the scope of the compression of 6553/6554 problem.
- How much effort to spend, and where shall the problem be solved.
- Explore the three alternatives; and the constraints on the solution space.

# Outcome

- Which WG should solve this problem,
- Scale and timing of solution.

[will the solution be 6lowpan-specific? shall it employ lossless compression?]

# **RPL Artifacts compression**

**by Pascal Thubert**

# draft-ietf-6tisch-minimal

- Last Call completed
- 6TiSCH supports classical PHY
  - Uncompressed RPL artifacts are show stoppers
  - Minimal needs a compression mechanism
  - Initially flow label, currently NHC
- Open issue on NHC reference
  - What if we do not reference anything
  - Else what should default be
  - Status on appeal to ADs
  - See Brian's answer next slide

# Talk with Brian Haberman

> All in all, if you agree, we can progress the draft in IESG review leaving that particular reference open to be changed till later in the process?

Why would you expect that to be acceptable? If a piece of the spec is needed for interoperability, it needs to be there during the review.

Why send it to the IESG if there are still questions on how that piece will be done? If it is left out, how will anyone know if there is consensus on the spec as a whole?

It seems to me that:

1. There have been several proposals put forth
2. Issues have been raised on each one

So, it seems prudent (to me) to look at each of the alternatives and determine which warts everyone concerned is willing to live with.

Running code is a good way to do that.

Making that determination needs to be done before the spec is sent to the IESG.

# Problem statement

- RPL adds 3 artifacts in data packets.
  - These are an IP in IP encapsulation,
  - an option in HbH header (called RPI) and
  - an RH (RH type 3).
- These artifacts are only partially and sub-optimally compressed in 6LoWPAN.
- The RPI is not compressed at all, consumes 8 octets per packet, and will cause IP in IP encapsulation in some packets.
- Any combination of artifacts is possible though RPI usually omitted if RH3 is present.

# More on RPL option [[RFC6553](#)] (RPI)

## 8-octets overhead for HbH header in data pkt

Almost innocuous with G-PHY (ZigbeeIP, CG-Mesh)

May cause fragmentation with classical PHY (127 octets/Frame in 2.4 GHz band)

Not compressed by 6LoWPAN HC

Wasted Energy in constrained devices

## Additional IP-in-IP encapsulation

Deeply aggravating factor for energy consumption and fragmentation

Needed when the packet flows outside the LLN to be able to add or remove the RPI (6MAN)

When does the RPI force IPIP encapsulation

When egress'ing the LLN

When ingress'ing the LLN

- Can the RH3 be added by an originating LLN node for intra-LLN traffic?

# Problem with RH3 [[RFC6554](#)]

## Only partial compression

Almost innocuous with G-PHY (ZigbeeIP, CG-Mesh)

[large MTU, but appropriate MTUs need to be advertised]

Elides common prefix in addresses

Still wasted Energy in constrained devices

## Additional IP-in-IP encapsulation

**Deeply aggravating factor for energy consumption and fragmentation**

**Needed for packets incoming the LLN (6MAN)**

## 6TiSCH supports classical PHY

Frame (128 bytes) size limits hops

# History

- ROLL agreed in Toronto to place the RPI data in the IPv6 flow label, which would reduce the per-packet overhead from 8 bytes into 20 bits and would avoid additional overhead from IP in IP encapsulation. Implementation was demonstrated at the 6TiSCH plug fest.
- Brian Carpenter reviewed the work and approved it, provided that the LLN operations would not leak outside the LLN.
- ROLL submitted the case to 6MAN for validation (that's the flow label draft)
- During the 6MAN review, it was suggested that an alternate approach to compress the RPI data could be found at 6lo, and evaluation work started in that direction (that's the NHC draft). 6MAN chairs confirmed recommendation not to use the flow label in chairs-ads exchanges
- 6TiSCH supported that work and asked for help from 6lo
- Reviewing the NHC draft in Honolulu, 6lo decided that we would need to understand how RH3 would be compressed in that approach to fully evaluate it.
- The authors found that extending the NHC approach to IP in IP and RH3 lead to too much implementation complexity, and that placing the RPL artifacts in a separate dispatch from the original packet lead to a more efficient processing at source, destination and intermediate nodes a better reuse of existing 6LoWPAN compression code. They produced a new draft called the Routing Dispatch draft.

# Proposals on the table

3 proposals to compress RPL artifacts in data not all of them necessarily in all packets, which makes the compression operation delicate:

- The most efficient is based on Flow Label (less bits and no IP in IP) but is incomplete since it does not cover the RH => now dismissed
- A 6LoWPAN alternate, the NHC draft, which also compresses the RPI, but requires IP in IP and does not cover RH either.
- Another 6LoWPAN alternate called the Routing Dispatch draft. This one addresses the whole story (IP in IP, RPI, and RH3). This is the response from the NHC authors to the 6lo concerns on the NHC approach.

# On the 6MAN side

3 possible outcomes on the IoT/FL question to 6MAN:

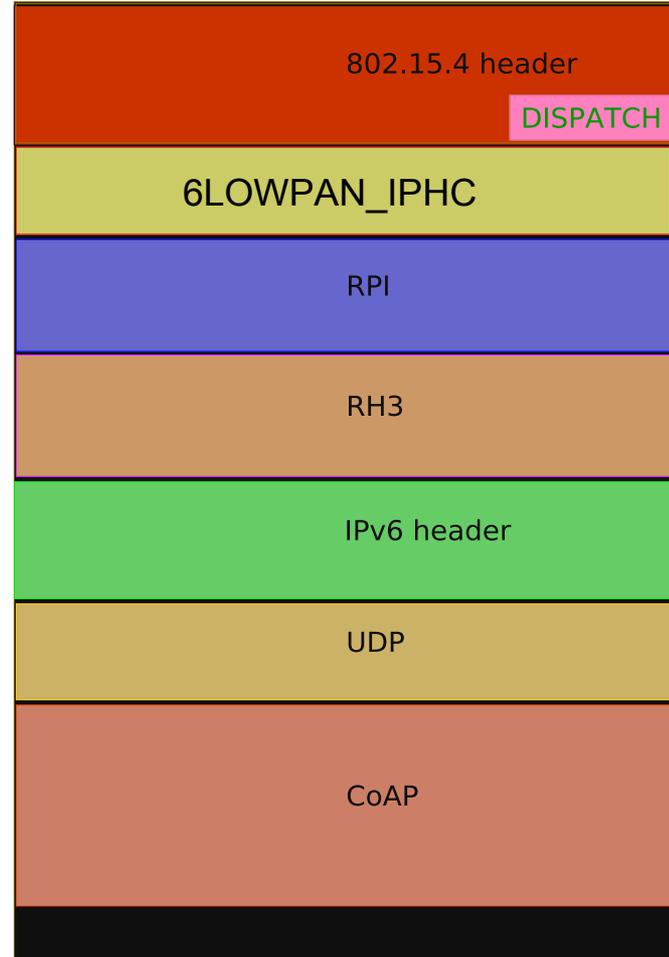

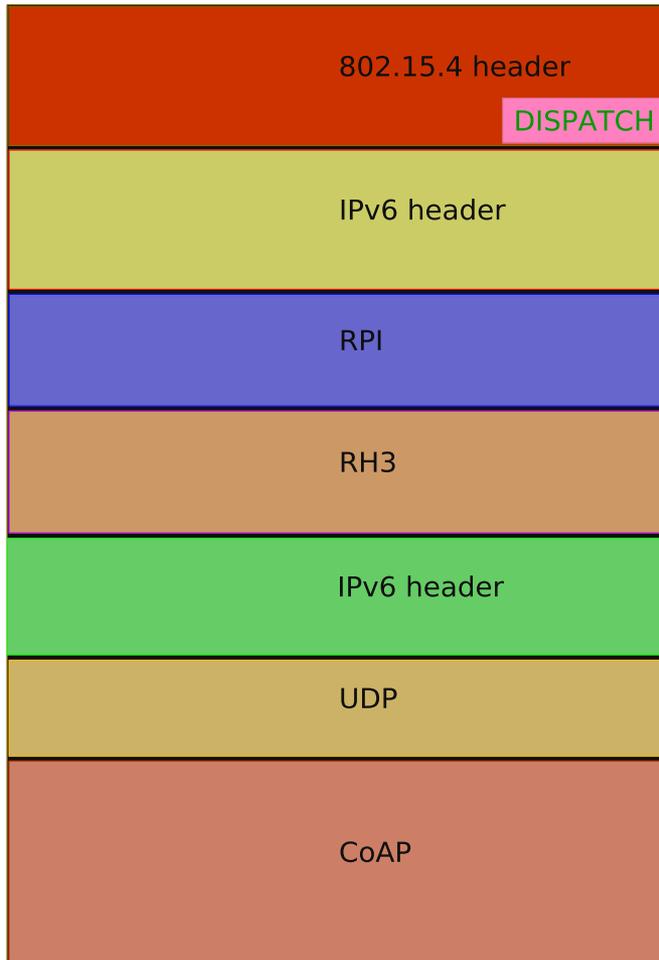

- No change to existing specs. In that case, even resetting the Flow Label inside the LLN is not acceptable. There are little chances that IoT devices conform.
- Only (re)setting the FL to zero inside the LLN is acceptable, in which case the FL cannot be used for RPI. This ask is critical for all LLNs and ensures continued conformance of existing standards such as ISA100.11a.**
- LLNs are free to use the FL as seem fit, as long as this activity does not leak outside the LLN and the setting of outgoing packets conforms 6437 (this is the current question of the 6MAN FL draft that Brian Carpenter reviewed)

# How does ISA100 use Flow Label

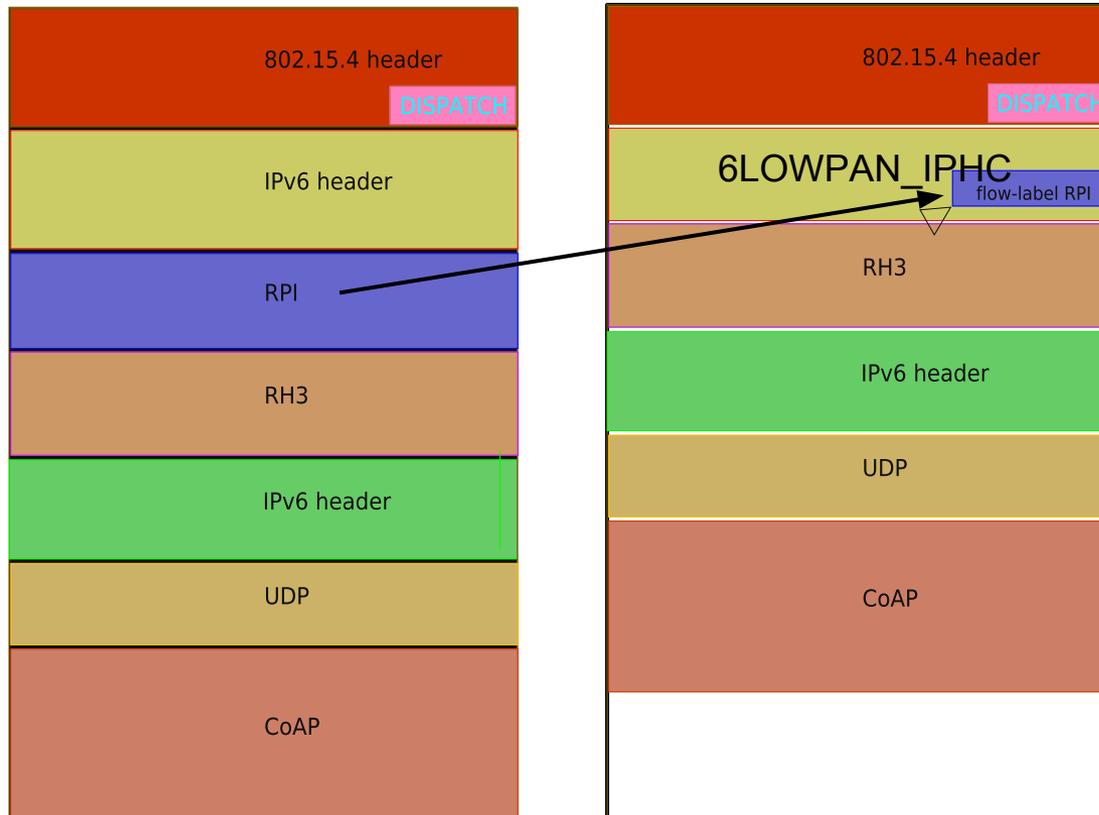

1. sets the flow-label at the end systems, it is unchanged throughout the LLN
2. the flow label is unchanged when the packet egresses
3. the flow label is usually set properly by corresponding nodes that sending into the LLN, but the gateway may, according to ACL, reset the Flow Label to a valid value.

*(Bob hints that even the ISA100.11a approach is not acceptable)*

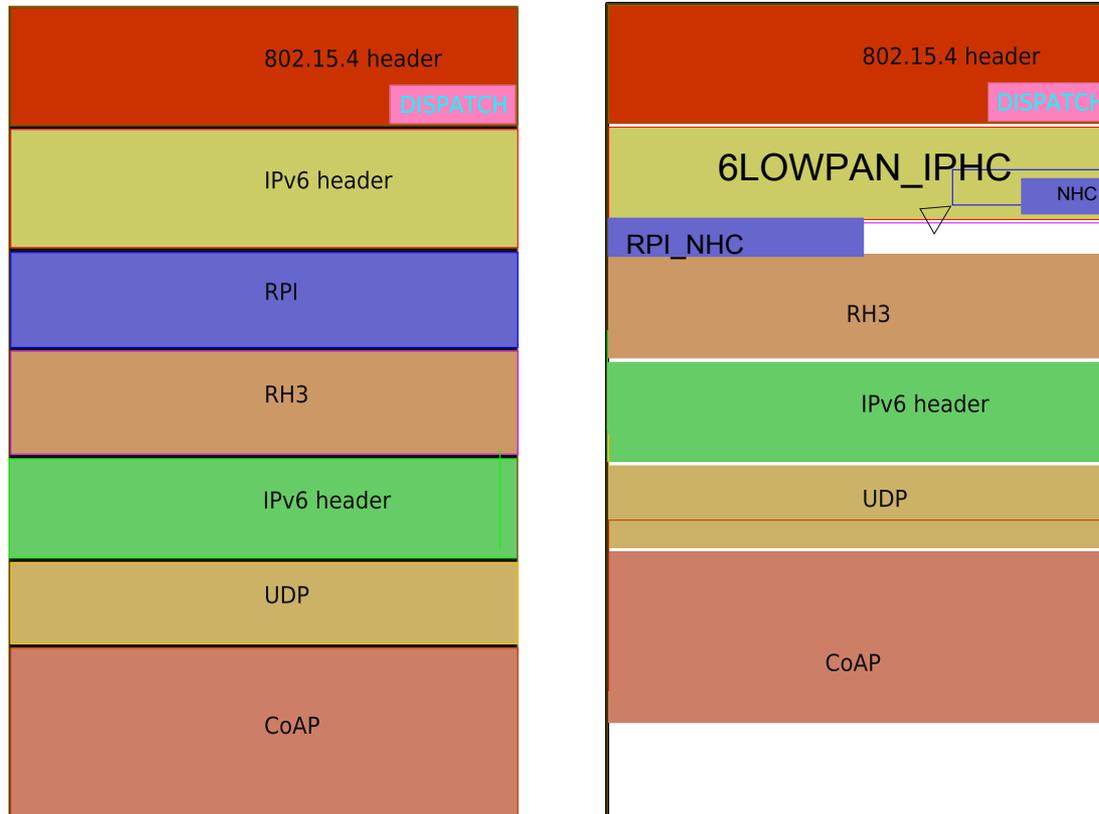

# Current base solution

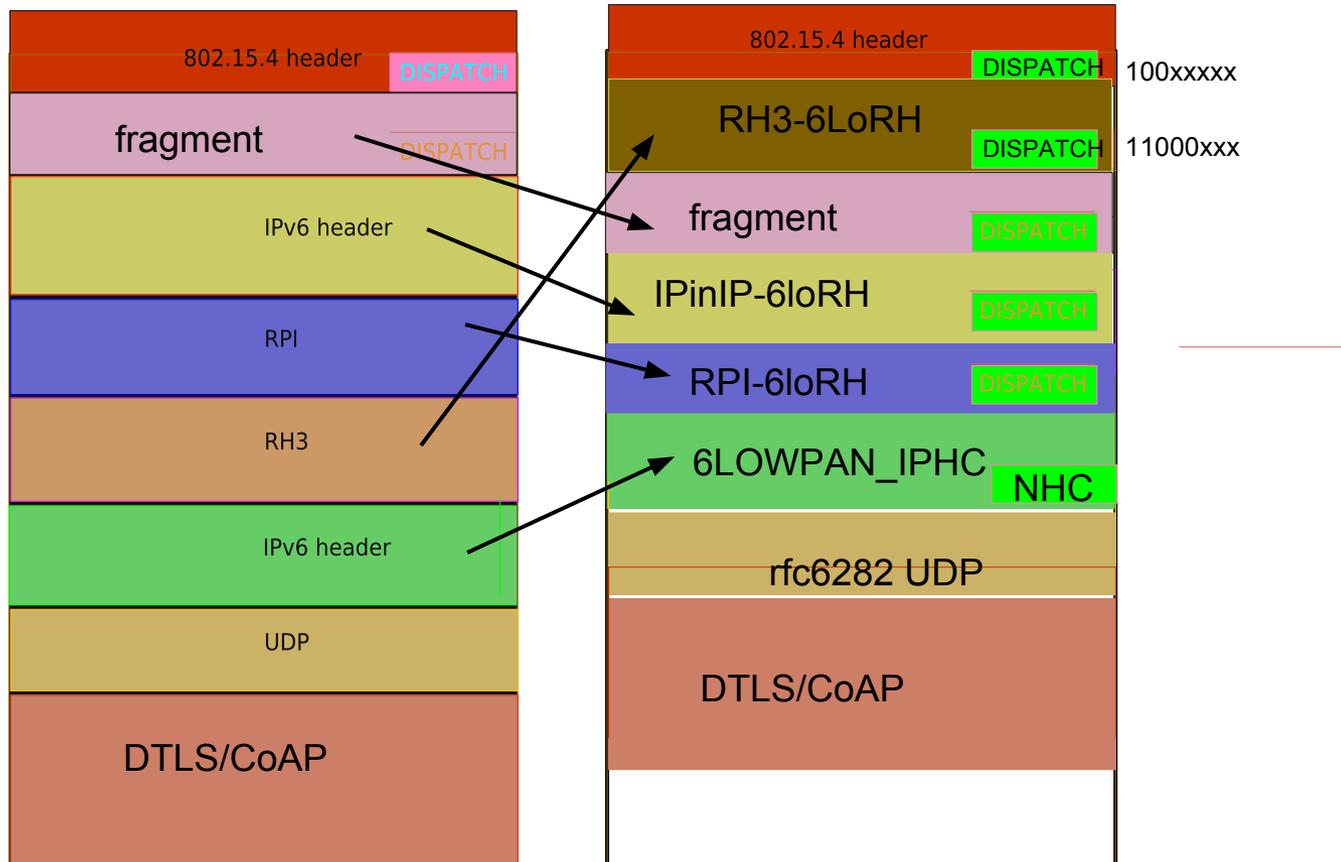

# Flow Label Proposal

# NHC solution: architectural view

# Dispatch: architectural view

**draft-thubert-6lo-rpl-nhc**

# draft-thubert-6lo-rpl-nhc

## Status

- 02 published
- Priority work due to 6TiSCH dependency

## Includes

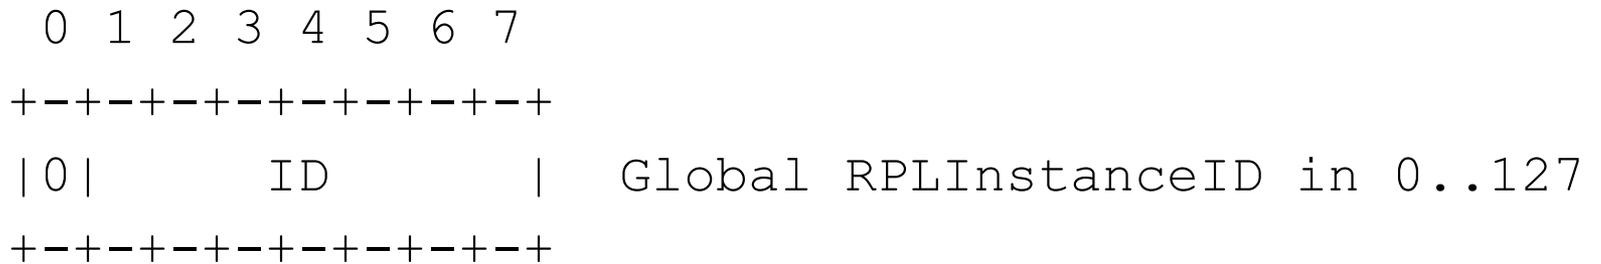

- 6lo next header compression (NHC) for the RPI\*
- 3 proposals for the exact format to debate

## Does not include

- RH3 compression
- IP-in-IP compression

\* Really: a compressed form for an IPV6 HbH header with a RPL Option that transports the RPL Packet Information (RPI)

# Compressing the RPLInstanceID

For the global Instance 0, the RPLInstanceID field is all zeroes  
Define 'I' flag that, when set, signals a global Instance 0, elided.

# Compressing the SenderRank

$$\text{DAGRank}(\text{rank}) = \text{floor}(\text{rank}/\text{MinHopRankIncrease})$$

If MinHopRankIncrease is set to a multiple of 256, the least significant 8 bits of the SenderRank will be all zeroes; by eliding those, the SenderRank can be compressed into a single byte.

Define a 'K' flag that, when set, signals that a single byte is used.

# Compressing the RPLInstanceID

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
| NHC: I=1, K=1 |   SenderRank   |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
    The most compressed RPI_NHC
```

```
0                               1                               2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
| NHC: I=1, K=0 |           SenderRank           |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
    Eliding the RPLInstanceID
```

# Possible NHC encodings

## “Greedy” encoding option

Uses NHC 1:0:x:x:x:x:x for RPL opt. flags + NH flag

## “Conservative” encoding option

Adds to Ext. ID enum. of RFC 6282 LOWPAN\_NHC

An additional byte for RPI flags (vs. Greedy)

## “Efficient” encoding option

Trades Complexity for NHC footprint

Compression as good as “Greedy” in normal case

Breaks from simple RFC 6282 encoding model

Defines new escape mechanism

Inserts byte upon forwarding exception

# draft-thubert-6lo-rpl-nhc

## Status

- 02 published
- Priority work due to 6TiSCH dependency

## Includes

- 6lo next header compression (NHC) for the RPI\*
- 3 proposals for the exact format to debate

## Does not include

- RH3 compression
- IP-in-IP compression

\* Really: a compressed form for an IPV6 HbH header with a RPL Option that transports the RPL Packet Information (RPI)

# **draft-thubert-6lo-routing- dispatch**

# draft-thubert-6lo-routing-dispatch

## Status

- 03 published
- Federates authors of previous proposals

## Features

- Compression of all RPL artifacts
- Extensible through TLV
- Reuse of the mesh header in non-mesh-under
  - | 10 xxxxxx | MESH => 1/3 of 6LoWPAN addressable
  - Not backward compatible, implies different networks
  - Proposes a mesh header compression for mixed mode

# Why not NHC++ ?

## RFC 6282 Code Point starvation

- NHC “greedy” discussion => conservative use

## RFC 6282 Code Base

- Backward compatible code on IP
- Separate routing operation from endpoint

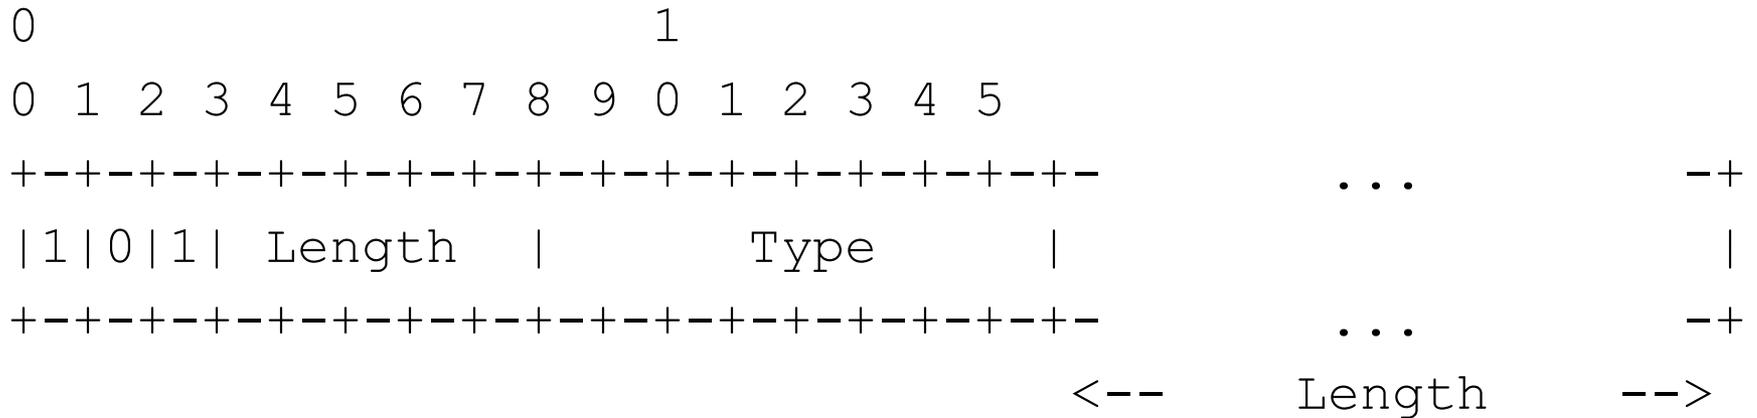

## RPL or not RPL?

- TLV space for other routing and tagging purposes

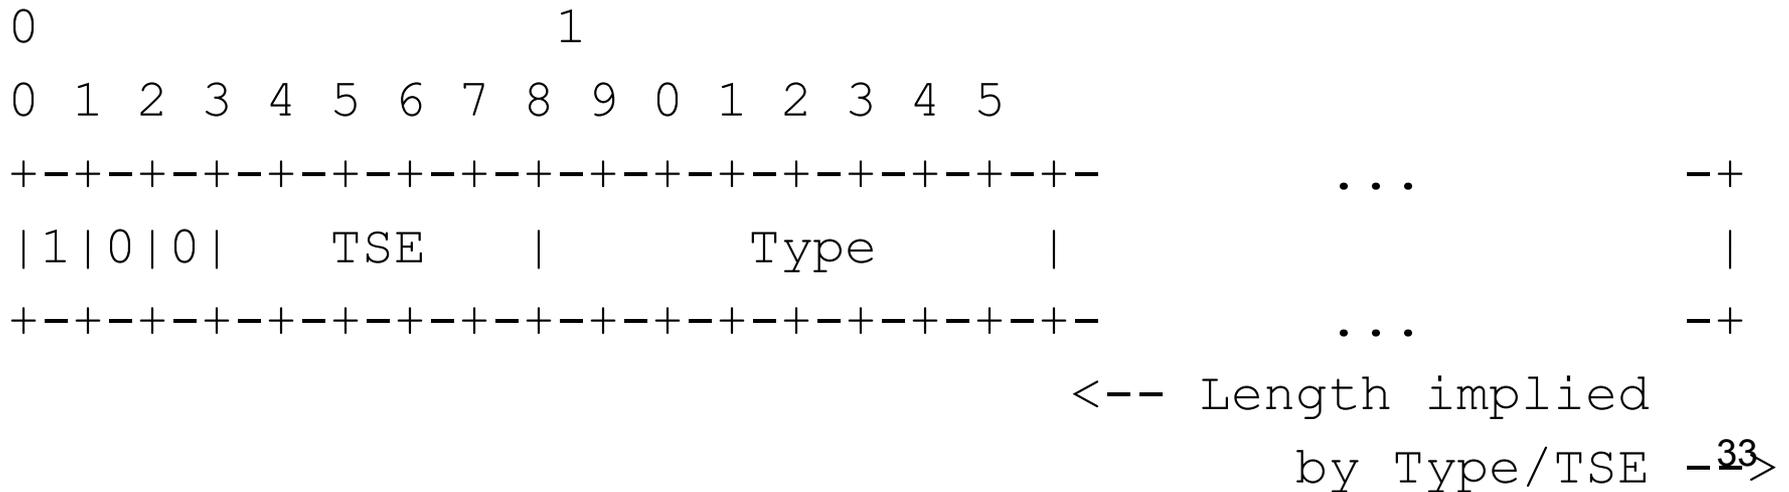

## Legacy hosts

- Allows decaps. of 6LoRH at penultimate node

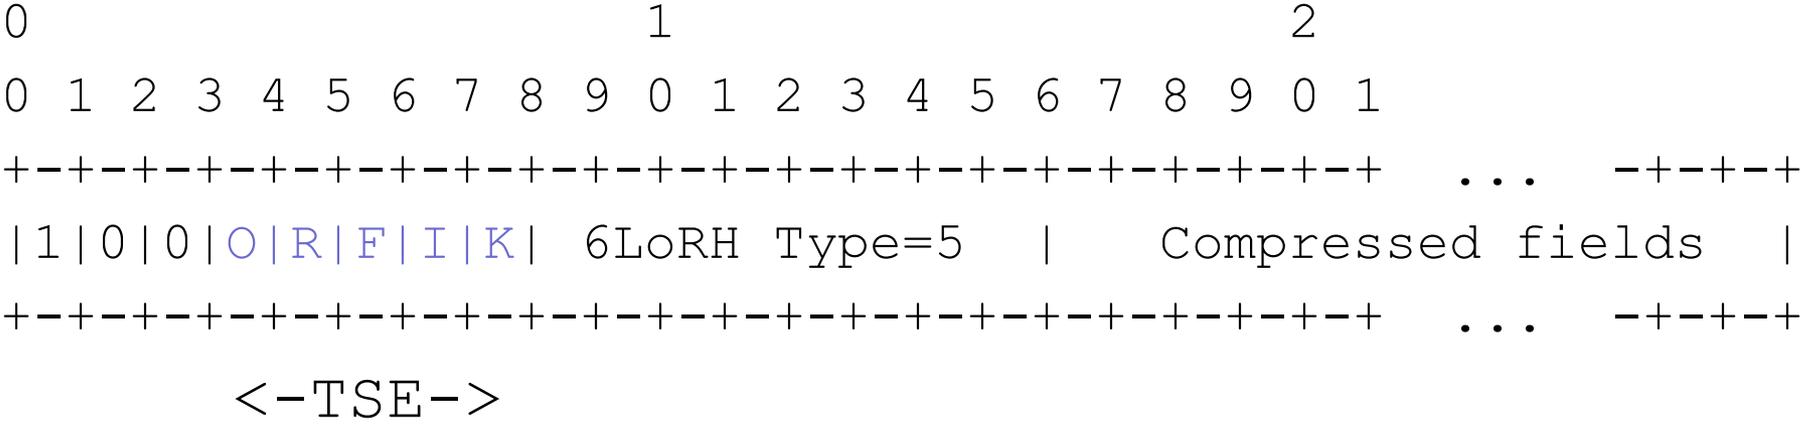

# Generic TLV format

Elective format (above) is skippable thanks to standard length field whereas Critical format is not. Length is derived from Type/ Type Specific Extension

# RPI-6LoRH

Critical format,

- O,R,F bits from RFC 6553 in the TSE
- Same I, K flags as in NHC proposal, placed in TSE as well
- Compressed fields inferred from I and K flags, 1 to 3 bytes

# Example use of RH3-6LoRH

## Root sends

0x80 0x04 <2001:DB8::ABCD> -> 1 \* 16-bytes address  
0x82 0x01 0xCAFE 0xBEEF 0xCA5A -> 3 \* 2-bytes addresses

## 2001:DB8::ABCD forwards

0x80 0x04 <2001:DB8::CAFE> -> 1 \* 16-bytes address  
0x81 0x01 0xBEEF 0xCA5A -> 2 \* 2-bytes addresses

## 2001:DB8::CAFE forwards

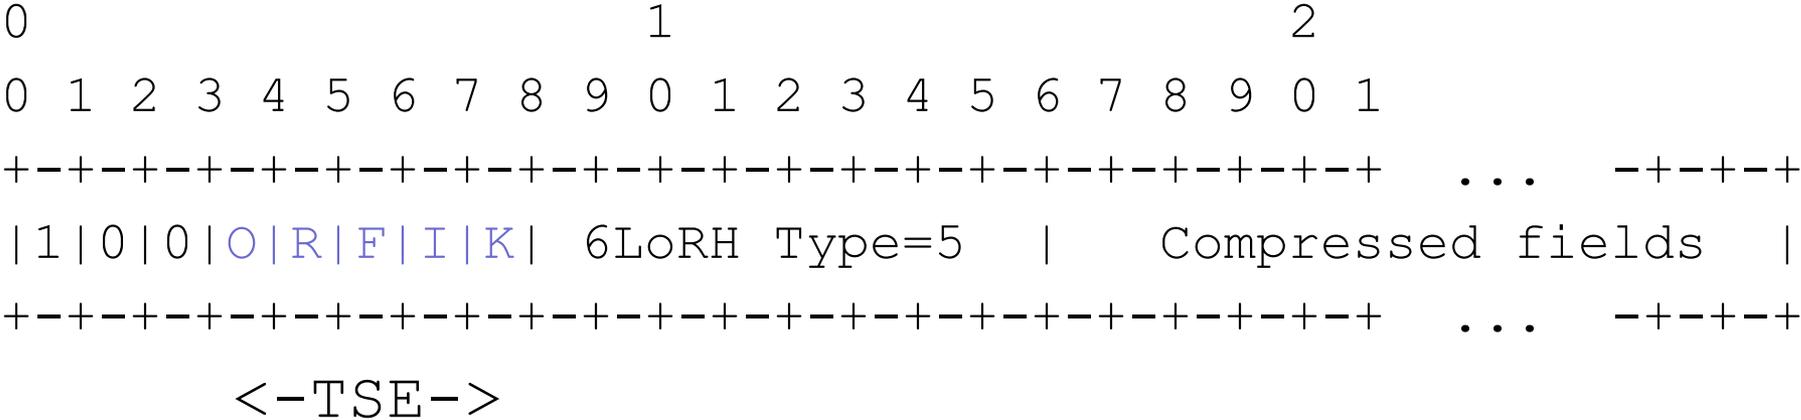

0x80 0x04 <2001:DB8::BEEF> -> 1 \* 16-bytes address  
0x80 0x01 0xCA5A -> 1 \* 2-bytes addresses

## 2001:DB8::BEEF forwards

0x80 0x04 <2001:DB8::CA5A> -> 1 \* 16-bytes address

2001:DB8::CA5A removes the 6LoRH and routes to dest. in IPHC

# RPI-6LoRH

Critical format,

<need to indicate whether to remove on penultimate>

O,R,F bits from RFC 6553 in the TSE

Same I, K flags as in NHC proposal, placed in TSE as well

Compressed fields inferred from I and K flags, 1 to 3 bytes

# **IETF 93 - 6tisch Interop**

Which approach to use for that?

# Conclusions:

to be filled in during meeting

# Acknowledgment

Thank you very much to Pascal Thubert for the slides
