IETF Core WG Interim Meeting 2021-09-29
Latest developments

• Continuing to incorporating feedback received for updates, corrections and clarifications

• 3 Github issues remain
  • 2 technical issues
  • 1 editorial issue
Technical Issue 1: Value of “Band” attribute

• Conditional attributes “lt” and “gt” indicates the limits where the value of the resource SHOULD cross before triggering 1 (and only 1) notification
Technical Issue 1: Value of “Band” attribute

• Band enabled and gt=2 and lt=12
Technical Issue 1: Value of “Band” attribute

• Band is an xs:Boolean but is its value significant?
  • Github Comment 1: “The band attribute is defined as a boolean type, but the use of the band attribute is determined by its presence, not its value. We should probably explicitly explain that.”
    • Accept both band=1 and band=0 as setting the notification band
  • Github Comment 2: “Do we need the band attribute to have a value to begin with? This query component can simply be a name, instead of name-value pair (i.e. band does not have any datatype).”
    • Example: /temperature?band&gt=30&lt=35

• Alternative: Don’t have “band” at all, and allow “gt” and “lt” to trigger ALL notifications after threshold is crossed (instead of just once)

• How do we set/unset band and have multiple bands (as described in the draft)?

• Opinions?
Technical Issue 2: Proxy considerations

• Proposed text for Implementation Considerations:
  • “This specification defines conditional attributes that can be used with CoRE Observe relationships between CoAP clients and CoAP servers. However, it is recognised that the presence of 1 or more proxies between a client and a server can interfere with clients receiving resource updates, if a proxy does not supply resource representations if the value remains unchanged (eg if pmax is set, and the server sends multiple updates when the resource state contains the same value). A server MAY use the Max-Age option to mitigate this by setting Max-Age to be less than or equal to pmax.”
