;# include

```
;# include draft-ietf-cbor-time-tag-02.txt as time-tag
event-start = time-tag.etime
```

Only what is referenced is actually imported
default import: undefined references?

Old RFCs: export ...all... as RFCnnnn
(per-section exports as in RFC8610.D for the prelude?)

How does this work

```
cddlc -2 -tcddl input.cddl > processed.cddl
```

(cddlc 0.1.x series for now)
Find referenced documents in

— "batteries included" (RFCs included in gem)

— current directory

Should there be another place?
