

Pushing Labels

- When an MNA Aware node is pushing labels onto an existing label stack
- And that label stack has at least one HbH MNA substack
 - Presumably within the visible stack region
- Then there are behavioral requirements to meet the overall framework
 - Individual action definitions may specify more

Required Behavior when Pushing

- If the pushed label stack has no HbH MNA
 - And if it pushes the visible HbH Substack out of range
 - Then a copy of the incoming visible MNA substack has to be added to the pushed label stack
- If the pushed label stack has an HbH MNA
 - Then a copy of the content of the incoming, visible, HbH MNA Substack must be added to the pushed HbH MNA substack
 - Conflict resolution is a local matter
